A Yearly Problem

BRENT VINE

University of California, Los Angeles

1. The regular forms of the isolated Greek adverb meaning 'this year' are Att. τῆτες [Aristoph.+], Ion. σῆτες, Dor. σᾶτες, with the same word almost certainly reflected in Myc. (KN, PY) *za-we-te* (/t^{s}ā̯u̯etes/, /k^{y}ā̯u̯etes/, vel sim.). The non-standard forms in alphabetic Greek are probably of no historical interest,[1] with the possible exception of τῆτα, treated briefly below.

The traditional interpretation of Att. τῆτες etc.[2] rests on a comparison with the adverb Att. τήμερον, Ion. [Hom.+] σήμερον, Dor. σάμερον 'today'. These forms are assumed to go back to a Pr.-Gk. **kᵢ̯-āmeron*, an adverbial accusative of an adjective **-āmero-* (cf. ἐφήμερος 'lasting a day', αὐθήμερος 'happening that very day', and adv. αὐθήμερον 'that very day' ~ Cret. αὐταμεριν 'id.'). This adjective **-āmero-*, in turn, is derived from the word for 'day' (neut. **āmr̥/*āmōr*) that appears in Hom. ἦμαρ and Myc. *a-mo-ra-ma* 'every day'; and **-āmero-* is itself preceded by a particle **k̂i-* 'this', an allomorph of the widespread PIE near-deictic particle **k̂e/*k̂i* (Lat. *cis* 'on this side', etc.), which also developed pronominal inflection using suppletive stems **k̂o-* and **k̂i-* (Hitt. *kā-/ki-* 'this', etc.). Greek **kᵢ̯-āmero-*, then, allegedly continues a univerbated phrase **k̂id āmr̥* 'this day, today', comparable to similar expressions for 'today' elsewhere, as in OCS *dĭnĭ-sĭ* or Go. *himma daga*, among others. Thus Att. τῆτες etc. would reflect a secondarily-formed "**kᵢ̯ā-u̯etes*", with "**kᵢ̯ā-*" extracted from the first syllable of **kᵢ̯-āmeron* by false division. The form itself would be an adverbial neuter accusative of an *s*-stem adjective **kᵢ̯ā-u̯et-és* 'this year's', comparable to adverbs like [Hom.+] αὐτόετες 'within the same year' and τρίετες 'three years long'. Finally, these presumed compound *s*-stem adjectives (i.e. **kᵢ̯ā-u̯et-és* 'this year's', and more generally **X-u̯et-és* 'having X years, X years long') would be related to the basic *s*-stem noun **u̯ét-os*, obl. **u̯et-es-* 'year' (cf. Myc. *we-to*, Hom. ἔτος) in the usual way, as with dozens of paired simplex and compound *s*-stem forms of the type μένος 'spirit' beside εὐμενής 'well-disposed'.

---

[1] Dor. τῆδες [Schol., Suid.] ("Dor. τη-" is suspicious, cf. also Buck 1955:60f. on sporadic voicing fluctuations); Dor. τᾶτες [Schol., Suid.]; τῆτα [Suid.] (perhaps a remodeling of τῆτες via the "adverbial -α" of ἅμα 'at the same time' and other such forms).

[2] E.g. Schwyzer 1939:613n7, Frisk II.895, and many others.

2. More recent discussions have added little to this picture. Nevertheless, valid questions have been raised and minor revisions suggested, mainly with regard to the following points: the nature of the univerbation behind **ki̯-āmero-* (§2.1.); the morphology and semantics of adverbial **-āmeron* in τήμερον etc. (§2.2.); and the phonological development of **k̂i-ā°* to (pre-Myc.) **ki̯ā°* (§2.3.).

2.1. Despite OCS *dĭnĭ-sĭ* and the like, it is not easy to see how an original phrase **k̂id āmr̥* could have been "univerbated" to something like **ki̯-āmero-*. As an alternative,[3] it may be attractive to assume that the original sequence could have had the particle **k̂i* in adverbial function ('hier, jetzt'), i.e. (in Dunkel's conception) **k̂i āmr̥* 'der Tag hier' → **ki̯-āmero-* 'zum Tag hier gehörig'. Although it does not seem to have been noted in this connection, this behavior can be paralleled in Hittite: besides attributive usage of pronominal *kā-/ki-* 'this' (e.g. *keti* UD-*ti* [*šiwatti*] 'on this day'), note adverbial *kā* 'here' in *kā* UD-*at* [*šiwat*] 'here on the day' = 'today'.

2.2. In a study of Hom. νύκτάς τε καί ἦμαρ 'night and day = constantly' and related material (including τήμερον and τῆτες), Barnes (2006) has offered a number of interesting suggestions. His main morphological conclusions affecting τῆτες etc. are as follows. First, **-āmero-* is best thought of as a substantival usage of an original bahuvrīhi, of the type Lat. *triduum* 'period of three days' < *'having three days', or AV+ *ekarātrá-* '(sacrifice) consisting of one night'; so also Myc. *di-wi-ja-me-ro* (TH Gp 109) '(sacrifice/festival) consisting of two days',[4] like Cypr. *pe-pa-me-ro-ne* 'period of five days'. Such formations can also be used adverbially (cf. again Lat. *triduum*, also 'for three days', like Av. *θri. aiiarəm* 'id.'), and moreover, adverbial forms of this type can develop secondarily, based on univerbations: e.g. **aut' āmar* > Hom. αὐτῆμαρ 'on that very day' → **autāmeron* 'id.' (cf. Att. αὐθήμερον, Cret. αὐταμεριν [§1.]). In Barnes' view, then, Greek had a univerbated adverb **ki̯-āmar* 'today', which was the basis for the creation of **ki̯ā-u̯etes*; **ki̯-āmar* itself was later remade as **ki̯āmeron* (> τήμερον). More specifically, **ki̯ā-u̯etes* was formed (beside **ki̯-āmar*) by analogy with **$X_{[\text{numeral}]}$-āmar* (Hom. ἐννῆμαρ 'for nine days', etc.) beside **$X_{[\text{numeral}]}$-u̯etes* (Hom. τρίετες 'for three years', etc., §1. above).

In some respects, especially with its more explicit formulation of the derivational morphology, this conception marks a substantial improvement over the traditional account in §1.; but problems remain.

---

[3] Dunkel LIPP s.v. **k̂e*, similarly Peters 1980:291.

[4] Similarly de Lamberterie on the Mycenaean form, cf. Guilleux 2000.

2.3. One such problem concerns the phonological development of the presumed /ki-ā-/ to /kiā-/,[5] which cannot result from any regular process, barring a "secondary iotization".[6] The expected development, rather, would be /ki-ā-/ > /kiiā-/ (or even, if early enough, from the laryngeal hiatus: **k̂i-h₂ah₁-* > /ki.ā-/ > /kiiā-/).[7] Peters (followed by Barnes) proposes that the regular result of pre-Myc. **ki-* (at least before back vowel) is Att. σ- (not τ-), given Att. σοῦσθαι 'be in motion' < **kiou-éie/o-*; and if that is correct, Att. τήμερον and τῆτες cannot be lautgesetzlich results of **ki-*. Peters' solution appeals to the "South Greek" (Mycenaean, Cypriote) syncope pattern /(-)kii-/ > /(-)ki-/ (whence, in initial position, a secondary /tˢ-/ > Att. τ-); cf. (in medial position) Myc. *ka-zo* 'of bronze' < */kʰalkio-/ < **kʰalkiio-*.[8] If indeed the starting point is disyllabic /ki-ā-/, this approach seems attractive. But despite Peters, Att. σοῦσθαι (attested in Attic drama only) could well be an Ionicism (cf. Lejeune 1972:110 on Att. σεύω : Hom. σεύω 'set in motion'), in which case Att. τήμερον/τῆτες could indeed result directly from a /ki-/ of whatever source. It becomes especially important, then, to consider whether the starting point really requires a sequence /ki-ā-/, a problem to which I return toward the end of this paper (§10.).

3. The basic claim about the origin and nature of Greek **kiā-uet-es* (as in §1., i.e. "**ki-āmeron* + **uét-os/*X-uet-és* → **kiā-uet-es*"), with or without various improvements just discussed (§2., e.g. Barnes' **kii-āmar*, or Peters' conception of the phonology of the initial sequence), remains difficult because of two hitherto neglected questions: first, how can one justify the resegmentation of **ki-āmeron* to **kiā-uet-es*? (§3.1.); and second, how can one explain certain facts about the actually-attested *s*-stem adjectives **X-uet-és* and about the *s*-stem compound adverbs in question (i.e., the alleged adverbial accusatives **X-uet-es*, including **kiā-uet-es*) with which they are supposed to correlate? (§3.2.). Consideration of these issues will then lead to the formulation of two working hypotheses (§3.3.), to be explored in the remainder of the paper.

3.1. The metanalysis in question, though casually accepted from the time it was proposed by Brugmann over a century ago (see Schwyzer 1939:319n2), seems open to question: why would speakers reanalyze **ki-āmeron* or **kii-āmar* so as to extract, by false division, a prefix or first compound member "**k(i)iā-*", with a meaning 'this-'? Resegmentation is a linguistic commonplace; but one

---

5 In addition to Barnes 2006, see earlier on this problem Peters 1980:290f.

6 On secondary iotization in Thessalian, see García Ramón 2007:182f.

7 I.e. Gk./Arm. **āmr̥/*āmōr* to the root **h₂eh₁-* of Pal. *ḫa-a-ri* 'is warm' (Barnes 2006 and others).

8 On this type of syncope, see also Weiss 1994:153f.

can usually point to favorable conditions in support of the process. In contrast, reinterpretations "**ḳ̂i̯ā-meron*" or "**ḳ̂i̯i̯ā-mar*" cannot be defended via any suitable /-mero-/ or /-mar/. At best, one might imagine reinterpretation as a contraction-product of "**ḳ̂i̯ā-(ā)meron*" (or "**ḳ̂i̯i̯ā-(ā)mar*") — but why? There is no usable /k(i)i̯ā-/ in support of such a conception. It is instructive to consider, by way of comparison, a widely accepted instance of false segmentation in early Greek. Hom. ἀλλοδ-απός 'belonging to another (people/land), foreign' led to the secondary creation (by metanalytical false division) of Hom. τηλε-δαπός 'from afar, foreign', whence ultimately formations like παντο-δαπός 'of all kinds' [hCer., Sappho+]. Here, various contributing factors helped support this development, including the existence of the adverb Hom. τῆλε 'far off, abroad' (beside the synchronically clear formative element ἀλλο-, with similar meaning), as well as the fact that -απός (→ "-δαπός"), synchronically, was semantically empty (apart from its adjectival force). The lack of such a network of contributing factors seems troubling in the case of "**ḳ̂i̯-āmeron → *ḳ̂i̯ā-û̯et-es*", and so the comparison with ἀλλοδ-απός → τηλε-δαπός, while superficially parallel, is in fact not supportive. If, then, there are reasonable doubts about the alleged metanalysis, the alternative worth considering is that the **ḳ̂i̯ā°* (of **ḳ̂i̯ā-û̯et-es*) may itself be an archaism requiring explanation; and if so, **ḳ̂i̯ā-(ā)meron* might have been formed after **ḳ̂i̯ā-û̯et-es*.[9]

3.2. Much more important are certain morphological (and phonological) considerations concerning the *s*-stems in question. Note first that even though Myc. *za-we-te* and its alphabetic descendants are taken to be adverbial versions of *s*-stem adjectives with second member **-û̯et-és*, such adjectives practically do not exist as such until after Homer; and *za-we-te*/τῆτες itself *entirely lacks* a corresponding *s*-stem adjective.[10] In Homer, nearly all the forms are adverbial: in addition to αὐτό-ετες, τρί-ετες (already cited), also πεντά-, ἑξά-, ἑπτά-, εἰνά- (with adverbial forms attested for these six words 15x in all), vs. acc. sg. ἑξέτε'(α) 'six-year-old' (2x), acc. pl. οἰέτεας '(born) in the same year' (1x); similarly adv. πάνετες 'all year long' (Pi. *P.* 1.20), without corresponding adjective.[11]

---

[9] A similar conception seems to have been envisioned by Sihler, who sets up a pre-form **ḳ̂yeh₂-wet-es*, though without explanation for "**ḳ̂yeh₂-*" (1995:286).

[10] In the absence of an adjective †τητής 'this year's', first-millennium Greek resorts to other strategies.The adverb itself can be used attributively (e.g. ἐς τον σατες ἐνιαυτον, IG XIV.256.9 [Gela]); otherwise, adjectival substitutes for 'this year's' (all post-Homeric) include ἐπιέτης, αὐτενιαυτός, τητινός.

[11] As discussed below, the profile just sketched is also highlighted by Meissner (2006:205) as linguistically significant.

Generally overlooked in this connection is that the Mycenaean adverb *za-we-te* does indeed have a corresponding adjective — yet it is not an *s*-stem. Instead, we have a thematic *r*-stem adjective, seen in masc. *ẓạ-we-ṭẹ-ṛọ* and fem. *ẓạ-we-te-ra* (both KN) 'this year's'. Although these forms are not mentioned by Rau in his discussion of Greek compound *r*-adjectives with the structure $X_{[numeral]}$-(ϝ)έτηρος [Hom.+] 'having X (number of) years' (2007:285ff.), it is evident that Myc. *ẓạ-we-ṭẹ-ṛọ/ẓạ-we-te-ra* belong together with such forms, for which Rau argues convincingly against an *s*-stem source like **u̯etes-ro-* (2007:285n23).[12]

Note finally that all such alleged *s*-stem forms with 'year' as second member, whether adverbs or adjectives, show an anomalous accent: thus for the adverbs, the attested pattern is τρίετες etc. (and not, as expected, oxytone †τριετές); and an animate adjectival form like Hom. οἰέτεας (acc. pl.) is so accented, as opposed to the expected paroxytone †οἰετέας. For τῆτες itself: this form is uniquely attested, and not the oxytone †τητές one might expect, if this were really a neuter accusative of an *s*-stem adjective. No satisfactory account of this feature has been proposed.[13]

3.3. These points raise the following question about the alleged background of "**ḳ̯ā-u̯et-es*" (as well as τρίετες etc.): What sort of putative *s*-stem adjective (a) makes a corresponding *r*-stem adjective in Mycenaean and Homer; (b) has hardly any corresponding *s*-stem adjective forms in Homer (and in the case of the adverb 'this year', *no* corresponding *s*-stem adjective forms); and (c) has an anomalous accent for an *s*-stem adjective? The provisional answer must be that these forms may not be *s*-stem adjectives at all. To rephrase this result, as well as the reservations in §3.1., as a pair of hypotheses about Pr.-Gk. **ḳ̯ā-u̯et-es*: (i) **-u̯et-es* is historically not an *s*-stem adjective, but something else, the nature of which remains to be elucidated; and (ii) if **k(i)i̯ā-* was not metanalyzed from **ḳ̯-āmeron* (or **ḳ̯i̯-āmar*), it may be a morphological entity in itself, the nature of which must also be clarified.

---

[12] The connection of Myc. *ẓạ-we-ṭẹ-ṛọ/ẓạ-we-te-ra* with [Hom.+] X-(ϝ)έτηρος is signaled explicitly by Bartoněk (2003:219); differently Docs.[2] and others, see Aura-Jorro 1993:456 s.v. *ẓạ-we-ṭẹ-ṛọ*.

[13] Stüber provides a useful discussion of the problem (2002:51). Her own solution begins, reasonably enough, from the better-attested adverbial forms like τρίετες; but the idea that such forms could have been influenced by the affective accent-retraction of a few adverbs like ἄληθες 'oh, really? (ironical)' (vs. ἀληθής 'true'), whence back-formed adjectives τριέτης etc., is wholly unconvincing. Meissner's approach to the problem will be discussed below (§4.1.).

4. If **-u̯et-es* is not an *s*-stem neuter adjective (acc. sg.) taken adverbially, two alternatives present themselves: first (§4.1.), as recently proposed by Meissner (2006:205), it could be the endingless locative **(-)u̯et-es-Ø* of the *s*-stem noun **u̯ét-os* (obl. **u̯et-es-*) 'year', as a univerbated second compound member; or secondly (§4.2.), again as a univerbated second compound member, it could be the old form **(-)u̯et-es* of the genitive or ablative singular of a root noun.

4.1. At first glance, the analysis as endingless locative seems attractive: first of all, an original endingless locative **u̯ét-es* or **u̯et-és* provides an elegant solution to the problem of the anomalous accentuation (§3.2.) — Meissner's primary interest in offering this analysis, along with the need to explain the high concentration of adverbs in the earlier material. Further, this analysis invites comparison with Dor. αἰές (beside Ion. etc. αἰεί), often taken, likewise, to reflect an isolated endingless locative.[14] Finally, a **-u̯et-es-Ø* 'during the year' could perhaps be aligned with the **u̯et-es+i* in Myc. *we-te-i-we-te-i* 'every year', which (apart from the *āmreḍita* iteration) looks like an endingless locative singular filled out with the locative desinence **-i*. Nevertheless, other features would remain without explanation: (i) the weak and generally late attestation not only of corresponding *s*-stem adjectives **X-u̯et-ēs*,[15] but of *all* types of adjectival forms based on the *s*-stem, including simplex **u̯eteh-i̯o-* (> ἔτειος 'yearly, one year long' [Pi.+]) or **u̯etes-no-* (unattested);[16] (ii) the relationship between the *s*-stem noun and the adjectival forms in *-r-*, for which the supposed endingless locative of an *s*-stem offers no insight.

4.2. In contrast, a root noun interpretation has a number of attractive features. This is the conception to be developed from a formal perspective in the remainder of this section, and in terms of meaning in §5.[17]

The PIE root noun **u̯et-* 'year', first of all, is well-established, as in Hitt. *wett-/witt-* (Kloekhorst 2008:1014f.), and indirectly in the forms pointing to a

---

[14] On αἰές (as loc. sg. of amphikinetic **h₂éi-u̯-ōs*, cf. acrostatic **h₂ói̯-u-s-* in Ved. *áyuṣ-*), see Nussbaum 1986:144n12, although an alternative analysis will be mentioned below. Gk. αἰεί is traditionally taken to continue a form "*αἰϝέσ-ι" (e.g. Schwyzer 1939:547, Frisk I.35 s.v. αἰεί), but this is far from certain; see rather Weiss (1994:133n6) for analysis as a dat. sg. **h₂ei-u̯-ei* to acrostatic **h₂ói̯-u-*.

[15] In marked contrast to other early *s*-stem pairs: in addition to μένος/-μενής (§1. ad fin.), also Hom. βέλος/-βελής, ἔπος/-επής, κλέος/-κλεής, and many others.

[16] In contrast to forms like **kleu̯eh-i̯o-* (cf. Myc. *e-te-wo-ke-re-we-i-jo*), and the numerous early **-es-no-* adjectives (Hom. ἄλγος/ἀλγεινός, κλέος/κλεινός, etc.).

[17] The idea that τῆτες etc. might reflect the genitive singular of a root noun was tentatively suggested by Ṣihler (1995:285f.), though without discussion.

PIE adverb **pér-ut(+i)* 'last year' (based on the locative of the root noun),[18] among other possible traces.[19] Within Greek itself, apart from the frozen form πέρυσι(ν) (and Myc. *pe-ru-si-nu-wo* etc.), a trace of the root noun may survive in the isolated accusative νέωτα 'next year' [Semon.+], although the details remain unclear (see Frisk II.313 s.v., **neu̯o-* + **-u̯ŏt-m̥* or **-u̯et-m̥*), and still other interpretations are possible (see recently Schaffner 2004:293f.). In theory, the form τῆτα (Suid., cf. §1. above with n. 1) might also belong here (as acc. sg. **ḳi̯ā-u̯et-m̥* '[for the duration of] this year'), and other possible traces of the root noun in Greek will be noted below.[20]

The idea that **ḳi̯ā-u̯et-es* is based on a root noun is immediately attractive in view of the corresponding *r*-stem adjective **ḳi̯ā-u̯et-ēr-o-* (Myc. *ẓa-we-ṭe-ro/ẓa-we-te-ra*): as Rau has shown (2007:285ff.), the Greek X-(ϝ)έτηρος adjectives derive ultimately from an *er*-locative **u̯et-ér* 'during the year', a formation based on the root noun. We may note in passing that the unexpected double full grade in the *r*-locative **u̯et-ér* (for ideal **ut-ér*; similarly its hysterokinetic derivative **u̯et-ḗr* [not **ut-ḗr*] → **u̯et-ēr-o-*) can be explained in various ways, as Rau discusses (2007:290 with n. 35); so, too — via some of the same arguments, which need not be rehearsed here — can the double full grade be explained in a gen./abl. sg. **(-)u̯et-es*, whether the root noun was originally of the *e/zero* type, with ideal gen. sg. **ut-és*, or of the *ó/é* type, with gen. sg. **u̯ét-s*. (I return to this uncertainty below, in §7.)

The late development of "true" *s*-stem adjective forms for 'year' can also be explained on the basis of a root noun, in at least two ways. First, given the simplex *s*-stem noun **u̯ét-os/*u̯et-es-* (clearly attested in Mycenaean), inherited compound adverbs with a shape **X-u̯et-es* (even though historically based on a case form of the root noun) might almost automatically have been reinterpreted as neuter forms of compound *s*-stem adjectives. Alternatively, one could appeal to a process documented independently for Greek, whereby compound adjec-

---

[18] Ved. *parút*, Gk. πέρυσι(ν) (Dor. πέρυτι(ς)) and the derived adjective Myc. *pe-ru-si-nu-wo*, *-nwa-o* (etc.), Att. περυσινός 'last year's', Arm. *heru*, ON *í fjǫrð*; for further detail, see Griepentrog 1995:444ff. (with references) and Schaffner 2004:294f.

[19] Other remains of the root noun may survive in Hitt. *we/iz(za)pant-* 'old' (Rieken 1999:26, Kloekhorst 2008:1017f.; see also Ivanov 2007:204 for additional Hittite material), Ved. *-vát* 'à la manière de' < *'au temps (de)' (Pinault 1985:364ff.), TB *nauṣ*/TA *neṣ* 'dans ce temps-là, auparavant' < *'dans cette année-là' (Pinault 2006a:276). For the verbal root **u̯et-* that may underlie the word for 'year' (cf. Mlr. *fethid* 'goes, makes one's way'), see Schaffner 2004.

[20] Indirect evidence of a root formation also appears in ἔταλον/ἔτελον 'yearling', among other *l*-forms; see in detail Rau 2007:284n19.

tives with root noun as second member develop secondarily into compound *s*-stem adjectives: e.g. **X-bʰuH-s* → X-φυής.[21]

Finally, in terms of form: the otherwise anomalous *s*-stem accent would not be anomalous, under a root noun interpretation: proparoxytone τρί-(ϝ)ετ-ες etc. would show the normal accentuation of compound root nouns, as in Hom. (gen. sg.) τρί-ποδ-ος '(cauldron) with three legs', etc.

The ending **-es* (of Myc. *za-we-te*, Hom. τρί-(ϝ)ετ-ες, etc.) is indeed best interpreted as genitive singular, and not ablative, as discussed in §5. This differs formally, of course, from the genitive desinence **-os* that Greek generalized for consonant-stem inflection; but the ending of **ḳi̯ā-u̯et-es* and like forms would be a relic, of the same type as the genitive singular in a relic like (ἐ)χθές 'yesterday' (more on which below).

5. In terms of function, note first that **-u̯et-es* in Myc. *za-we-te* and its first-millennium descendants is "locatival" in meaning: these forms mean '(within, during) this year'; e.g. PY Ma 225 (*za-we-te* correlated with *pe-ru-si-nu-wa* 'last year's'), or Aristoph. *V.* 400 ὁπόσοισι δίκαι τῆτες μέλλουσιν ἔσεσθαι 'whoever is going to have lawsuits this year'. The same feature appears in Hom. αὐτόετες (γ 322) 'within the space of a year, during one and the same year' (as also for the adjective αὐτοέτης [Thphr.+]).[22]

For a root noun meaning 'year', such a usage is best interpreted as a "genitive of time", a well-attested feature of Indo-European case grammar, as in familiar forms of words for 'day' and 'night' (e.g. Hom. νυκτός 'by night', RV *sadívas* 'on the same day', *sadyás* 'id.' and 'right away', *aktós* 'by night', perhaps OLat. *dius* 'by day', *nox* 'by night'). Here note in particular, beside the root noun forms RV *sadívas* and *sadyás*, the frozen genitive singular **-di̯-és* of the root noun 'day' (comparable to *sadyás* < **sm̥-di̯-és*) in the second member of the archaic compound meaning 'yesterday' (Ved. *hyás*, (ἐ)χθές, Lat. *herī*, etc.), on which see Schindler 1977:34 (with further detail in Vine 2008a). The word for 'day', moreover, shows that a genitive of time can coexist with other time-expressions, such as those expressed by instrumentals (RV *adyā́/adyá* 'today' < **-di̯-éh₁*) or locatives (*-en*-locative **di̯-én-* → **di-n-* 'day'; details in Rau 2006); there is thus no difficulty with parallel formations **u̯et-es* (gen.) and **u̯et-ér* (loc., §4.2.).

All this suggests that the durational sense of the numerical adverbs (Hom. τρίετες etc., mainly *Odyssey*) is secondary. Such forms, first of all, are inher-

---

[21] See on this pattern Weiss 1994:150f., similarly Stüber 2002:52, 65.

[22] Messap. **ạtavetes** (MLM 1 Br), often placed beside αὐτόετες (e.g. Frisk I.583), is in fact completely obscure, as Meissner points out (2006:162, cf. already Frisk's recantation, III.95); see MLM 2.3.1 s.v., with references.

ently ambiguous: thus αὐτόετες 'within a single (entire) year' is practically equivalent, in some contexts, to 'for a whole year'; similarly τρίετες 'during three years' ~ 'for three years' (cf. ἔτειος, both 'yearly' and 'one year long'). In addition, as a variation on the analogical relationship suggested by Barnes (§2.2.), one could suggest the following development, based on durational adverbs of the type "numeral + ἦμαρ":

> αὐτῆμαρ 'on the same day' (γ 311 + 2x) : αὐτόετες 'in the same year' (γ 322) :: ἑξῆμαρ 'for six days' (4x *Od.*), ἐννῆμαρ 'for nine days' (12x [5x *Od.*]) : *X*

where *X* = ἑξάετες 'for six years' (γ 115), εἰνάετες 'for nine years' (γ 118 + 4x [3x *Od.*]), πεντάετες 'for five years' (γ 115), ἑπτάετες 'for seven years' (γ 304 + 2x *Od.*), τρίετες 'for three years' (4x *Od.*).

6. The analysis just sketched has interesting implications for a series of additional sigmatic forms of the word for 'year' (§§6. and 7.) and for the presumed *s*-stem noun **u̯ét-os/*u̯et-es-* itself (§8.).

Consider first the fact that words for 'day' and 'year' often pattern together (witness **ḱi̯āmeron/*ḱi̯āu̯etes* themselves, or Gk. dial./*koine* καϑ' ἔτος, ἐφ' ἔτος etc., with aspirated "ἕτος" after καϑ'/ἐφ' ἡμέραν etc. [Buck 1955:54, Schwyzer 1939:305]). Given, in addition, the archaic "genitive of time" forms **sm̥-di̯-és*, **sm̥-diu̯-és* 'on (one and) the same day' (Ved. *sadyás, sadívas*), this suggests the possible existence of a form **sm̥-u̯et-es* 'during (one and) the same year'. Indeed, forms pointing to such an etymon exist:

(i) Hitt. *šāudišt-* (OH+), *šāwidišt-* (NH) 'suckling, of suckling age' (of animals);[23]

(ii) RV *saṃvatsará-* m. 'a single year' (8x, esp. loc. *saṃvatsaré* 'at the end of a year') and *saṃvatsarīṇa-* 'jährig' (post-RV also 'jährlich'), *saṃvátsam* 'one year long' (IV.33.4, 3x);

(iii) Hom. οἰέτεας (B 765) 'of the same age' = '(born) in the same year' (cited above, §3.2.).[24]

While the Homeric form is largely ignored in the literature, the first two are traditionally interpreted as based on the primitive PIE *s*-stem **u̯ét-os/*u̯et-es-* (cf.

---

[23] For philological details concerning Hitt. *šāudišt-* and related forms, see Rieken 1999:147ff., with references. (On the basis of Rieken's demonstration that the form means 'suckling' and not necessarily 'yearling', Meissner [2006:162] summarily rejects the widely-accepted etymology based on the 'year' word.)

[24] For various details and references, see Latacz 2003:248f., ad loc.

again Myc. *we-to*, Gk. ἔτος), with prefixed **s(o)m-*; and the assumption of an *s*-stem basis is also standard for Ved. (RV+) *vatsá-* 'calf' (**u̯et-s-ó-*), and for some other sigmatic forms.[25] But in view of the above analysis of Myc. *za-we-te* etc., I suggest that these forms are based rather on a genitive singular ("genitive of time") **s(o)m-u̯et-es* 'during the same year' (built to the root noun **u̯et-*) — i.e., exactly like **sm̥-di̯-és/*sm̥-diu̯-és* 'on the same day', and like the **-u̯et-es* compound that underlies Myc. *za-we-te* 'during this year' and its first-millennium counterparts — and have nothing directly to do with a PIE *s*-stem.

6.1. For Hitt. *šāudišt-*, the primary morphological issue[26] concerns its secondary derivation with a dental formant. But this fits very well with other isolated cases of "decasuative" substantivization via **-t-*, a pattern treated extensively by Nussbaum (e.g. 2004): thus Hitt. *išpant-* 'night' is a delocative substantivization based on the *-en*-locative **kʷsp-én* 'at night' (→ Av. *xšapan-* 'night'), cf. the root formation in Ved. *kṣáp-*, Av. *xšap-* 'night'. Similarly, Pike (2007) has analyzed the isolated *t*-stem in Lat. *salūs* (stem *salūt-*) 'health' in essentially the same terms, i.e. as a deinstrumental substantivization to **sl̥H-u-h₁* 'with wholeness', from the paradigm of the *u*-stem noun underlying the thematized adjective **s(o)lH-u̯-o-* 'whole' (Ved. *sárva-*, Gk. ὅλος, Lat. *salvus* etc.). I see no difficulty, then, in considering Hitt. *šāudišt-* 'suckling (animal)' (< **'yearling') to be a degenitival substantivization of the same type, based on **s(o)m-u̯et-es* '(born) during the same (i.e. current) year'; hence **s(o)m-u̯et-es-t-* 'that which belongs to the same year'.[27]

6.2. For the Vedic forms: despite Pinault (1985:366f.), there is no *s*-stem "Ved. **vat(a)s-*" from which these forms can be derived. Rather, they can again be based on an old genitive of time to the root noun. Thus, as Pinault recognized, Ved. *-vatsar-*[28] is based on a suffixed *-er*-locative **vats-ár*; but rather than being based on an *s*-stem, this can be viewed as a reinforcement of the "locatival" sense ('during the year') of the old genitive of time **u̯et-es*, based on the root

---

[25] In addition to the relevant handbooks, see more recently Rieken (1999:147, 222), Stüber (2002:31, 188f.), and Kloekhorst (2008:739f.) on the Hittite material, and Pinault (1985:366f.) on Ved. *saṃvatsará-* etc. I return to Ved. *vatsá-* in §7.

[26] There is no space here to discuss Kloekhorst's alternative conception of the phonology and morphology of the Hittite form, whence (in part) his preference for first member **so-* (following Kimball 1999:233) — a theory that suffers from its forced separation of the Hittite form from the other material in this section.

[27] A somewhat similar formulation (though based on the *s*-stem) is offered by Rieken (1999:150n705), as an alternative.

[28] Including, besides the forms in (ii) above, *parivatsaré* 'in an entire year' (X.62.2), adj. *parivatsarī́ṇa-* (VII.103.8).

noun. For the pattern, compare Lat. *herī* 'yesterday', where the Italic avatar (**χes*) of the old gen. sg. **ĝʰh₁-di̯-és*, by that time opaque, was reinforced by extending the form with the transparent locative formant **-ei*. As for RV *saṃvát-sam*: this shows an extension with the adverbial formant *-am*, well-attested in Vedic adverbs of time and distance, whether these are obvious accusative singular forms (as in *sāyám* 'in the evening', cf. *sāyá-* 'evening') or not (e.g. *cirám* 'for a long time'; adj. *cira-* 'long' only Ep.+).

6.3. Despite its low profile in the linguistic literature, Hom. οἰέτεας 'of the same age' = '(born) in the same year', a hapax in the "catalogue of horses" (B 763ff.), deserves to be placed with the forms just discussed. Various details about the word and its Homeric context, such as its adjacency to the hapax ὄτριχας 'with the same hair',[29] or the somewhat arcane nature of the metrical lengthening it displays,[30] need not detain us. More important for present purposes is the fact that the word refers to horses, of interest given the well-established fact that the "animal husbandry" use of **u̯et-* 'year' is archaic (as in Hitt. *šāudišt-*, Ved. *vatsá-* 'calf', Lat. *vitula/vitulus* 'id.', and a number of other forms — including the adjectives in X-(ϝ)έτηρος [Hom.+], and comparable *r*-forms in Vedic and Germanic, on which see Rau 2007).[31] If, as I suggest (and as also seen by Meissner, cf. §3.2.), the Greek *s*-stem adjectives based on the word for 'year' are secondary to the adverbial use, then the adjective οἰέτεας could be based on an adverb *ὄ(ϝ)ετες '(born) during the same year', identical or virtually identical to Hitt. *šāudiš-t-* (minus the *-t-*) and to Ved. *saṃvats-*, as an original genitive singular **s(o)m-u̯et-es* 'during the same year'. The Homeric adjective was then extended to a numeral form, i.e. acc. sg. ἑξέτε'(α) 'six-year-old' (Ψ 266, 655, with reference to a mare and a mule, respectively) — the only other *s*-stem adjective form of this root in Homer.

Greek may also provide another trace of **s(o)m-u̯et-es* (or at least of **-u̯(e)t-es*), in Myc. *au-u-te* (KN Od 666.b), if (as often thought) the form means 'this (same) year',[32] with possible support from the gloss αὐετῆ· αὐτοετῆ Hsch.[33]

---

[29] Thus providing two of the three instances (cf. ὄπατρος 'with the same father') of Hom. "copulative omicron" (traditionally seen as the Aeolic version of copulative alpha < PIE **sm̥-*; see Chantraine 1958:25, 186 and Risch 1974:216).

[30] I.e. οἰέτεας for †ὀέτεας, as originally explained by Wackernagel (see Chantraine 1958:99, Wyatt 1969:172ff.).

[31] Note also the Mycenaean syllabogram WE as used with animals (KN, PY, and now also in the TH Wu nodules), perhaps in part reflecting a word like /u̯etalon/ 'yearling' (cf. n. 20 above).

[32] See Docs.² 537 s.v., Bartoněk 2003:347, Aura Jorro 1985:146 s.v.

[33] Hsch. αὐετ- and Hom. αὐτοετ- (§§1., 3.2., 5.) could be viewed as renewals of a more

Even if an interpretation of the sort /ha-(u̯)ut-es/ (as if from *sm̥+ut-és*) cannot yet be justified (and there is no space here to take up the problem), the form at least seems likely to offer additional Greek support for the root noun **u̯et-* 'year', quite possibly in the form of a genitive singular ("genitive of time") in an old compound.[34]

7. Other sigmatic forms based on the word for 'year' deserve to be reconsidered in light of the above discussion. Recall once again the universal assumption that Ved. *vatsá-* 'calf' reflects a thematized derivative (with possessive meaning) based on the PIE *s*-stem **u̯ét-os/*u̯et-es-* 'year', i.e. **u̯et-s-ó-* 'having a year' = 'one year old (animal), yearling'.[35] To this can be added the *i*-stem forms in Celtic words for 'sow' (OIr. *feis*, MW *gwys* etc.), which according to Stüber (2002:188f.) point to a **u̯et-s-ih₂* (cf. OIr. gen. sg. *feise*, nom. pl. *feisi*) — i.e., the feminine counterpart to **u̯et-s-ó-*, both terms (in Stüber's view) of PIE age, along with the *s*-stem.

Nevertheless, I suggest once again that **u̯et-s-ó-* and **u̯et-s-ih₂* need have nothing to do with an *s*-stem, and can instead be based on a genitive singular **u̯et-es* 'during the year', whence a thematization **u̯et-s-ó-* '(characteristic of) that which is (born) during the (current) year'. The same could apply to Alb. *viç* 'calf (up to one year)', which requires a preform of the type **u̯etVs+* (e.g. **u̯eteso-*; so Demiraj 1997:418, following Pedersen and others).[36] *Mutatis mutandis*, the thematic forms in Luvian and Lycian (CLuv. *ušša/i-*, HLuv. *u-sa/i-*, Lyc. *uhe/i-*), which ended up meaning simply 'year', could be interpreted in a similar way.[37] From a formal point of view, the pattern seen here amounts to

---

archaic /ha-(u̯)ut-/, with substitution of the more transparent forms -ϝετ- and αὐτο- (cf. already Myc. *au-to-jo*) for the two morphemes in question.

[34] Similarly Tremblay (2002:117): "*αὐϋτες 'cette année' (ϝέτος)", comparing PIE 'yesterday' for the suffix. I hope to explore elsewhere the possibility that [Hom.+] ἐνιαυτός 'anniversary; year', ἐνιαύσιος 'one year old; annual' (cf. Myc. *e-ni-ja-u-si-jo* MN) — hitherto etymologically obscure — also provide a trace of the root noun form of 'year' in an archaic compound similar to Myc. *au-u-te*.

[35] This assumption is ubiquitous in the handbooks and other secondary literature, and hardly requires detailed reference; recent mentions include Stüber 2002:31, 188; Schaffner 2004:292f.; Hartmann 2005:65; Meissner 2006:165; Rau 2007:281.

[36] I leave aside here various problematic forms with possible backgrounds in **u̯et-(e)s-*, e.g. Lat. *veterīnae/veterīna* 'beasts of burden' (traditionally placed with Ved. *vatsá-*, Alb. *viç*; differently Szemerényi 1989:94ff.) or the theonym U. **Vesuna** (see Wanders 2003 for interpretation as **u̯etsōnā* 'Lady of the year'; discussion in Weiss 2007 and forthcoming).

[37] On Sidetic *ośad*, perhaps 'by year, yearly', see Melchert, this volume (n. 6) and Pérez Orozco 2003:196. (I thank Craig Melchert for this reference.)

"decasuative thematization" — that is, thematization based on a case form, a securely-established process that is particularly well-attested for locative formants: **-en/*-er/*-i* → **-(e)n-o-*, **-(e)r-o-*, **-i̯-o-/*-i(i̯)-o-* 'that which is in/on X'.[38] In principle, nothing seems to exclude "degenitival thematization", perhaps especially natural given the locatival sense of "genitive of time" expressions. Certain hitherto difficult forms might well benefit from such a conception, although the point cannot be developed here.[39]

Two further points can be added concerning the forms discussed in this section. First, to generalize an observation made by Janda with regard to Hitt. *šāudišt-* (1998:612): the addition of **s(o)m-* 'one and the same' may redundantly specify (or may clarify) the meaning already carried by **u̯et-es* 'during the (current) year', an observation equally applicable to a form like Ved. *vatsá-*: i.e., *vatsá-* could be thought of as a "Kurzform" with the meaning of a **saṃvatsá-*, cf. RV *saṃvatsará-* '(one and the same) year' (§6.) vis-à-vis YV *vatsara-* 'year'. So also for O. **vezkei** 'new-born (?)' < *'yearling' (Sa 1 [Agnone Tablet]) < **u̯et-es-k-* ← **u̯et-es-t-*, beside the prefixed version in Hitt. *šāudišt-*, if Janda's interpretation of this controversial Oscan word is correct.[40]

Finally for this material, note that the precise interpretation of cases like Ved. *vatsá-*, *saṃvatsará-/saṃvátsam* (cf. also VS+ *trivatsá-* 'three years old' ~ Hom. τρίετες) depends on the difficult question (cf. §4.2.) as to which inflectional pattern the original root noun followed — that is, either the *ó/é* acrostatic type, with gen. sg. **u̯ét-s* renewed as **u̯ét-es*,[41] or, as others prefer,[42] the *e/zero* mobile type, with gen. sg. **ut-és*, also in principle renewable as a double full grade **u̯et-és*. A decision between the two is extremely difficult, and for the moment seems unnecessary: both versions are compatible with all of the genitive singular-based forms suggested here, whether these involve a double full grade **(-)u̯et-es(-)* (as in Myc. *za-we-te* etc., Hitt. *šāudišt-*, Hom. **ϝ̆(ϝ)ετες, Alb. *viç*), or a **(-)u̯et-es* that has undergone an early accent-related syllabic reduction of the type **u̯ét-es*

---

[38] On delocative thematization, see e.g. Mayrhofer 1986:161, Nussbaum 1986:236, 243 (and *passim*).

[39] A possible candidate might be Skt. *divasa-* [Ep.+] 'heaven, day' (cf. RV *sadívas*, §5.), as against earlier (and ill-founded) assumptions of an *s*-stem **dívas-* (see *EWAia* I.752).

[40] See Untermann 2000:854 for a range of other approaches (several also operating with a basis in the 'year' word).

[41] So Pinault 1985:367 and Rieken 1999:28, following Schindler 1972:33; more recently also Schaffner 2004:294.

[42] So Rau 2007:281 (with n. 3), following Nussbaum's argumentation (1986:83 nn. 106-7) based on **pér-ut+i* < ***pér-u̯et+i*, vs. the "ideal" loc. sg. **u̯ét(+i)* expected for a form belonging to the *ó/é* type.

or *u̯et-és > *u̯et-s-ó- (whence the Ved. -*vats*- forms or OIr. *feis*, etc.), or an original *(-)u̯et-s (whence the same forms, but in a direct way).

8. If, as I suggest, all of these words traditionally derived from a PIE *s*-stem do not in fact have this background, it is legitimate to wonder about the status of the *s*-stem itself. Stüber presents the *communis opinio* on the reconstruction of a PIE *s*-stem *u̯ét-os as follows (2002:189): "Aufgrund der angeführten Evidenz kann also mit Sicherheit ein *s*-Stamm *u̯ét-os 'Jahr' fürs Urindogermanische angesetzt werden". But what is the nature of that evidence? Compare her additional observation on the Greek evidence (2002:187): "Da ἔτος innerhalb des Griechischen keine Ableitungsgrundlage hat, kann allein aufgrund dieser [scil. Greek] Evidenz mit ziemlicher Sicherheit ein grundsprachlicher *s*-Stamm *u̯ét-os angesetzt werden". This assertion would be reasonable, but only if the assumption on which it is based is correct. In fact, absolutely direct evidence for the *s*-stem comes from Greek (Myc. *we-to*, [Hom.+] ἔτος) and nowhere else; yet it seems to me that even this, *pace* Stüber, calls for qualification. If the above analyses have correctly identified widespread derivational patterns based on the genitive singular of the root noun, then in theory, that very form could have served as the basis for the /u̯etehi/ of Myc. *we-te-i-we-te-i* 'every year' (surely an archaism already at that time, cf. the similar-looking relic *a-mo-ra-ma* [§1.]). Myc. /u̯etehi/, then, could be based on an archaic gen. sg. *u̯et-es 'during the year', secondarily extended by loc. sg. *-*i*, in a manner comparable to Lat. *herī* (§6.2.). Then, with the language having thereby evolved an apparent loc. sg. /u̯etehi/ 'during the year', the back-formation of a new *s*-stem /u̯etos/ 'year' might have been virtually automatic, and need not have occurred much earlier than the Mycenaean period. A scenario of this kind would also be consistent with the late development of all types of *s*-stem adjective, in early Greek, to this root (cf. §4.1.).

The only other more or less direct evidence for a PIE *s*-stem *u̯ét-os may appear in Lat. *vetus* (gen. *veteris*) 'old'. But this is highly doubtful (despite e.g. Stüber 2002:187f., Schaffner 2004:292, Meissner 2006:153n82); for an alternative account, assuming a secondarily-derived *s*-stem *u̯et-us-, see Nussbaum 1986:145n15 (and note the potential interest of OLat. VETVSIA for this conception; Vine 2008b:29n3). Finally, even if the Balto-Slavic forms pointing to a *u̯etus-o-[43] go back to an *s*-stem *u̯ét-us-, this form need not (*pace* Stüber 2002:187) be based on an *s*-stem *u̯ét-os, as the result of a contamination.[44]

---

[43] OCS *vetŭxŭ*, Lith. *vẽtušas* 'old'; I omit problematic Middle Iranian material here.

[44] See rather Nussbaum 1986:143ff. on the type Ved. *áyu-* 'life, vigor'/*āyuṣ-* '(long) life', *tápu-* 'hot'/*tápuṣ-* 'hot; heat', etc.

It does not seem far-fetched, then, to consider the PIE (or at least "early PIE") status of an *s*-stem **u̯ét-os* to be open to question, despite the standard assumption of such an entity hitherto. If there was in fact no primordial *s*-stem at all, we would also have a natural explanation for the unclear semantic distinction between the root noun and the *s*-stem forms, both of which simply mean 'year' (cf. Stüber's astute remarks on this problem, 2002:189).

9. It remains possible that an *s*-stem **u̯ét-os* existed at some stage of PIE; yet this could have arisen secondarily from a more archaic genitive of time based on the root noun. Independent support for such a scenario is available from E. Rieken's analysis of the *s*-stem forms of the word for 'month' (2001:77f.), arising from her identification of a primary amphikinetic *n*-stem in Hitt. *meyan-* (dat./loc. *meyani*) 'period of time'.

As Rieken points out, the *s*-stem forms of 'month' (Ved. *mā́s-*, Av. *må̄* [disyllabic], Ion. μήν/Att. μείς, Lat. *mēnsis*, Lith. *mė̃nuo* [gen. *mė̃nesio*], etc.) can go back to an amphikinetic **méh$_1$-n-ōs*.[45] This form, in turn, would be derived from the primary amphikinetic *n*-stem **méh$_1$-ōn* (or possibly *l/n*-stem **méh$_1$-ōl*) 'period of time, season' (: **meh$_1$-* 'measure') implied by Hitt. *witti meyani* 'at the annually recurring point in the year'. The derivational basis for the *s*-stem, she argues, was the *n*-stem genitive singular **meh$_1$-n-és* 'in dem Zeitraum': as a genitive of time, this could have been reinterpreted as the endingless locative singular of an amphikinetic *s*-stem, whence **méh$_1$-n-ōs*.

This development is formally parallel to one of the two types of secondary derivation based on *-er* and *-en* locatives, as recently discussed by Rau (2007:289, following Nussbaum 1986:187ff., 235ff.), namely "*-er/-en*-locative → back-formed *-r-* or *-n-* substantive" (the other pattern being "*-er/-en*-locative → internally-derived *-r-* or *-n-* substantive"). Once again, we would have parallel behavior between a genitive of time and various locative formants, here involving a particular type of secondary derivation; compare the parallels noted earlier involving degenitival substantivization (§6.1., Hitt. *šāudišt-*) and degenitival thematization (§7., Ved. *vatsá-* etc.). To apply this conception to the word for 'year': a PIE proterokinetic *s*-stem **u̯ét-os/-es-* 'year' could have arisen, within the protolanguage, as a reinterpretation of a genitive singular **u̯et-es* 'during the year' as a locative, according to a pattern "(athematic) genitive of time (with desinence **-es*) → back-formed *-s-* substantive", exactly parallel to the deriva-

[45] On this reconstruction, see Rau 1998:158, and more recently Vijūnas 2006:134, with other references.

tional pattern with locative formants just adduced, and precisely as seems to have occurred with the word for 'month'.[46]

From a broader perspective, the above discussion invites reconsideration of the general problem of secondary *s*-stems, especially those based on root nouns (see *in extenso* Nussbaum 1986:141ff., and the survey by Stüber, 2002:63ff.). At least a few items containing an otherwise obscure *s*-formant might benefit from the conception elaborated here. By way of example, RV+ *útsa-* 'well, spring' (: YAv. $^{+}$*usa-*) clearly belongs with the word for 'water', but despite e.g. *EWAia* I.213 s.v., there is no good evidence for an inherited *s*-stem: Nussbaum has shown (1986:203n16) that Gk. ὕδει (Hes. *Op.* 61, Theogn. 961W → ὕδος Callim.) is a secondary *s*-stem based on the root noun **u̯ed-* (cf. Hitt. dat.-loc. *witi*). It may be worth considering, then, whether IIr. **utsa-* is a degenitival (or conceivably deablatival) thematization (with subsequent substantivization) of gen./abl. sg. **ud-és* 'of/from the water' (cf. Skt. *divasa-*, n. 39 above).

10. I append some final remarks on the first member of Myc. *za-we-te* and its congeners. The task at hand is to consider whether Pr.-Gk. **ḳ̯ā-* (in **ḳ̯ā-u̯etes*, if not also in **ḳ̯ā-āmeron*) could be interpreted as an inherited form. I believe this is plausible, given the existence of a pronominal stem **k̂ḳ̯o-* beside **k̂o-/*k̂i-* 'this', and its documentable use (beside **k̂i/*k̂e* and **k̂o-/*k̂i-*) with words for 'day' and 'year' (§10.1.), and a possible historical interpretation of the ending "**-ā̃*" (§10.2.).

10.1. A pronominal stem **k̂ḳ̯o-* 'this', used with 'day' and 'year', is attested in Balto-Slavic and Albanian. Thus in Lithuanian, a stem **šḳ̯a-* provides the "heteroclitic" oblique form of *ši-* 'this' (e.g. masc. nom. sg. *šis* but gen. *šiõ*, fem. nom. sg. *šì* but gen. *šiõs*, etc.), and also appears as the derivational base of some adverbial forms (e.g. *šiaĩp(o)* 'in this way'). Latvian and Old Prussian have generalized the onset **šḳ̯-*, while Slavic shows the reverse generalization (masc. nom. *sĭ*, but gen. *sego* for expected **šego*, etc.).[47] The use of this pronoun together with 'day' was already noted above for Slavic, in OCS *dĭnĭ-sĭ* 'today' (§1.); cf. Lith. *šiañdien* 'id.', Latv. *šùodìen*, OPr. <*schan deinan*>, among other time-expressions (*sią̃žiem* 'this winter', etc.; Forssman 2003:185, 187f.). The same pronominal stem is also attested in Albanian — and significantly, there only in frozen time adverbs: *sot* 'today' (< **ḳ̯ā-dit+*), *sonte* 'tonight' (< **ḳ̯ā-nakt+*), *sivjet* 'this year' (< **ḳ̯ei-u̯et+*).

---

[46] As Alan Nussbaum points out to me, an analysis of this kind might also, in theory, be applicable to Dor. αἰές, which could thus reflect a frozen genitive, rather than the endingless *s*-stem locative usually assumed (cf. n. 14).

[47] For the Balto-Slavic material and its analysis in these terms, see Stang 1966:233.

The "heteroclitic" inflection of BSl. *$\hat{k}i$-/*$\hat{k}_{\underset{\frown}{i}}o$- 'this' is generally taken as secondary, based on the third person pronoun, where PIE *$(H?)i$-, and the relative pronoun *$H_{\underset{\frown}{i}}o$- fell together.[48] Such a conception works well enough for Balto-Slavic, but cannot account for Albanian, where *$\hat{k}_{\underset{\frown}{i}}o$- survives in frozen forms — including the word meaning 'this year' — and is difficult to account for secondarily.[49] It may be preferable, then, to assume that PIE already had a pronominal stem *$\hat{k}_{\underset{\frown}{i}}o$-, an entity that could have arisen in various ways on the basis of *$\hat{k}i$/*$\hat{k}e$ and *$\hat{k}o$-/*$\hat{k}i$-, just as with (or possibly even under the influence of) the PIE pronominal stem *$s_{\underset{\frown}{i}}o$- (Ved. *syá*-, and also, at least historically, Hitt. *šia*- 'one', with possible comparanda elsewhere) beside pronominal *so/*si- (fem. nom. sg. *si-h_2 etc.).[50]

10.2. As for the background of the desinence "*-$\bar{a}$" of "*$\hat{k}_{\underset{\frown}{i}}\bar{a}$" (in *$\hat{k}_{\underset{\frown}{i}}\bar{a}$-$u_{\underset{\frown}{e}}t$-$es$ 'this year'), an attractive hypothesis (all that can be offered, for the present) might consider this form a frozen "perlative instrumental" in *-$\bar{a}$ < *-eh_2-eh_1. The "perlative instrumental" (expressing traversal of, and location in, space and time) is well-attested in Vedic usage, with traces elsewhere; most important for present purposes, frozen forms of this type are commonly found as adverbs (cf. Lat. *citrā* 'on this side', *dextrā* 'on the right', *anteā* 'before', etc.), including adverbs based on deictic and other pronominal stems (cf. Lat. *hāc* '(over) here', *illāc* '(over) there', etc.; Ved. *káyā*, Gk. πῇ 'how, by what means' < *$k^{u}\acute{e}h_2$-eh_1).[51] Note further that the Hittite adverb *kā* 'here' (cf. §2.1. on *kā šiwat* 'today') could also continue an instrumental (i.e. < *$\hat{k}\acute{o}$-h_1; García Ramón 1997:140).

For the material at hand: a phrase *$\hat{k}_{\underset{\frown}{i}}\acute{e}h_2$-$eh_1$ *$u_{\underset{\frown}{e}}\acute{e}t$-$es$ 'here/now, during the year' = '(during) this year' (~ Hitt. *kā šiwat* 'here on the day' = 'today') could have been the source for the univerbation seen in Pr.-Gk. *$\hat{k}_{\underset{\frown}{i}}\acute{a}_{\underset{\frown}{u}}etes$ > Myc. *za-we-te* etc. The same *$\hat{k}_{\underset{\frown}{i}}\acute{e}h_2$-$eh_1$ could also be taken as the source of the frozen "prefix" (*$\hat{k}_{\underset{\frown}{i}}\bar{a}$-) in Alb. *so-t* 'today', *so-nte* 'tonight' < (pre-Alb.) fem. dat.-loc. *$k_{\underset{\frown}{i}}\bar{a}$-*ditāi*, *$k_{\underset{\frown}{i}}\bar{a}$-*naktāi*. On this basis, and given the feminine gender of both 'day' and 'night' in Albanian, *$k_{\underset{\frown}{i}}\bar{a}$- might naturally have been reinterpreted as feminine, whence a secondarily-created masculine dat.-loc. *$k_{\underset{\frown}{i}}ei$- in *$k_{\underset{\frown}{i}}ei$-$u_{\underset{\frown}{e}}tei$ > *si-vjet* 'this year', replacing an older *$k_{\underset{\frown}{i}}\bar{a}$-$u_{\underset{\frown}{e}}tei$. If something like this is so,

---

[48] So e.g. Stang, loc. cit. (n. 47), followed by Dunkel, LIPP s.v. *$\hat{k}o$-.

[49] Dunkel tentatively assigns the Albanian forms to the PIE pronominal stem *$t_{\underset{\frown}{i}}o$- (LIPP s.v.); but that seems improbable, in view of the idiomatic use of *$\hat{k}i$/*$\hat{k}e$ and *$\hat{k}o$-/*$\hat{k}i$- in PIE for time expressions like 'today', 'this year'.

[50] On Hitt. *šia*-, see Melchert (this volume) and Pinault 2006b:84ff.

[51] On the perlative instrumental and adverbial forms based on it, see García Ramón 1997:131ff. (and passim), developing an insight of Delbrück. For the Vedic usage, see also Hettrich 2002:52, 54f., 59ff.

then Gk. **ḳ̇i̯ā-u̯et-* would have an almost exact comparandum in Alb. **ḳ̇i̯ei-u̯et-* (← **ḳ̇i̯ā-u̯et-*). In contrast, **k̂i(-)/*k̂e/*k̂(i̯)o-* + **āmr̥* has no independent support outside Greek, apart from "typological" parallels (such as **k̂i-* + **di-n-* [BSl.], **k̂i-* + **dʰogʰ-* [Gmc.], §1.). It thus seems possible (as already mooted, §3.1.) that "**ḳ̇i̯ā-āmeron*" (or **ḳ̇i̯ā-āmr̥*) was secondarily formed in Greek, after an inherited **k̂i̯ā-u̯etes*, with the latter (already attested in Mycenaean) as the true archaism, rather than having arisen by false segmentation from **k(i)i̯-āmeron* (or **k(i)i̯-āmr̥*).[52]
