II.

UMBRIAN *AVIEKA-* 'AUSPICĀ-' (AND REMARKS ON ITALIC AUGURAL PHRASEOLOGY)

Brent Vine
University of California, Los Angeles

0. Introduction

A long and distinguished scholarly tradition has addressed what has come to be known as the Italic "Sakralsprache" – the highly formalized language of ancient Italic religion and ritual observance. Apart from early compilations[1] and treatments embedded in classic works on Roman (and early Italic) religion,[2] one thinks especially, in the modern period, of the classic treatment by Norden (1939). More recently, to cite only a few highlights, important work by Rix has explored relationships between Umbrian and Etruscan prayer language,[3] and the chapters by Watkins (1995) devoted to Italic religious language have analyzed this material (especially from Latin and Umbrian) in terms of its background in patterns of Indo-European poetics. As is already evident from this brief survey, much of this work has begun from a comparison between Latin religious language and that of the Umbrian Iguvine Tables, a rich and archaic repository of prayers, cultic formulations, and other technical terminology embedded in a remarkable compilation of ancient Italic religious instructions.[4]

Comparative studies of the kind just mentioned have pointed up essentially the same notorious difficulty that besets the analysis of ancient Italic data from a more purely linguistic perspective: that is, the difficulty of distinguishing inherited material in two related traditions (such as Roman and Umbrian) from shared material that arises from cultural contact, or even as a result of independent innovations reflecting similar linguistic responses to similar cultural conditions. The sphere of ancient Italic religious language, then, offers rich material for the study of cross-cultural and cross-linguistic strategies of "translation", in various senses of this term. Here we explore the linguistic background, in part still poorly understood, of a series of Umbrian terms related to augury, one of the most prominent forms of religious behavior shared with ancient Roman religion. New proposals about how best to interpret this background will lead to a reevaluation of how some of the fundamental augural expressions in both Latin and Umbrian may be related to each other.

[1] Notably Appel (1909). [2] E.g. Wissowa (1912). [3] See especially Rix (1985).
[4] The most recent large-scale attempt to elucidate some of the difficult language of this text is that of Weiss (2010), a work that also contains a valuable methodological introduction.

1. Umbrian avieka- and related forms

We begin by surveying the textual attestations of the Umbrian forms in question (all of them restricted to the Iguvine Tables), followed in section 2 by a preliminary descriptive analysis.

1. 1. U. **aviekate**

U. **aviekate** (dat. sg.), with adjectival meaning 'augural', appears at the beginning of table II in a phrase **karne** … **aviekate** 'for the augural section':

karne: speturie: atiieřie: aviekate (IIa 1)
"for the augural section of the Atiedian brotherhood which is under the protection of the god *Spetur*"[1]

The identical phrase is then repeated at IIa 3 as part of a quotation, following the instruction **esu: naratu** "he shall speak as follows". We will return later to **speturie** and its base form, the theonym **speture** (dat. sg., IIa 5). For now, it is sufficient to note that while the precise scope of activity of this deity is debated, the derivation from **speḱ-tōr* (: PIE **speḱ-* 'look at') and the connection of **karne** … **speturie** with augury are not in doubt.[2]

1. 2. U. **aviekla** etc.

Likewise with an adjectival meaning 'augural' (or the like), the word **aviekla** (and its variant forms) is found in two distinct collocations. The first refers to a **vea**/*via* 'road, way' (cf. Lat. *via*) designated the 'Augural Way':

vea: aviekla (Ib 14) = *uia . auiecla* (VIb 52)
"by/along the Augural Way"

Secondly, in combination with a word meaning 'stone' (acc. pl. [with postposition] **vapef-em**/*uapef-e*, abl. pl. *uapersus* and [with postposition] *uapersus-to*), the word refers to a set of 'augural stones':

[acc. pl.]	**vapefem: avieklufe** (Ib 14) *uapefe( )auiehclu* (VIa 10) *uapefe . auieclu* (VIb 51) "at the Augural Stones"
[abl. pl.]	*uapersus . auiehcleir* (VIa 9) *uapersusto( )auieclir* (VIa 12, 13) "from the Augural Stones"

These have traditionally been taken to be augural 'seats',[3] but they are more likely

[1] Transl. Weiss (2010: 44).
[2] See Watmough (1995-6: 111f.) and Untermann (2000: 691f., s.vv. **speture**, **speturie**). For a recent discussion of the structure of the Umbrian *auspicium*, see Sisani (2009: 92ff.).
[3] Details in Untermann (2000: 823f.).

boundary markers of the *auguraculum*.[1] The distinction is of no importance here: in either case, the contextual association with augury remains clear.

1. 3. U. *auie*

There is finally the *k*-less form *auie*, in the asyndetic sequence *uou{.}se . auie . esone* "in vow, in augury, (and) in sacrifice" (VIb 11).[2]

2. Preliminary descriptive analysis

2. 1. *Phraseology*

The vocabulary just surveyed, despite its universally acknowledged reference to augury, is actually not the unmarked way of referring to augury in Umbrian. Instead, we find the transparent phrasal expression 'observe the birds', as at the beginning of the text (**aves: anzeriates** = *aueis . aseriater* "once the birds have been observed", Ia 1 = VIa 1) and elsewhere (Ib 8 = VIb 47, etc.), cf. similarly 'observe' followed by enumerations of particular birds (as at VIa 2-4). This differs markedly from the material in section 1, all of which involves fixed or formal expressions. Thus **karne** … **aviekate** (1.1.) is evidently part of an extended official title, the formal nature of which is clear in the context of the opening of table II. Forms of **aviekla** (1.2.) are exclusively attested in two traditional designations ('Augural Way', 'the Augural Stones') essentially amounting to toponymic or locational expressions.[3] Finally, *auie* (1.3.) is part of an asyndetic tricolon – a three-member merism neatly encapsulating the universe of Umbrian ritual behavior – that is itself embedded, in its context, within a prayer. It is reasonable to conclude from these considerations that this material is archaic even within the range of traditional Umbrian expression found in the Tables, and arguably at least partly opaque synchronically, aside from a connection with U. **avi-**/*aui-* 'bird' (and in contrast to straightforward phraseology like 'observe the birds').

2. 2. U. **aviekate**

Descriptively, U. **aviekate**[4] is fem. dat. sg., belonging either to a perfect deponent participle (as if Lat. 'auspicatae', as the form is glossed by Buck, Vetter, and others) or (less likely) a present active participle **avieka(n)te** 'auspicanti', with preconsonantal "suppressed <**n**>" spelling.[5] In either case, we would appear to have a denominative stem **awi(y)ĕk-ā-* or **awi(y)ēk-ā-*,[6] with the participial usage

[1] Weiss (2010: 92n229), following Sisani (2001: 144).

[2] On this phrase see recently Weiss (2010: 214n254), with a morphological analysis of *uouse*.

[3] The format of the first is familiar from material elsewhere in Sabellic (e.g. O. **vía . púmpaiiana**, **vía . iúviia**, Po 1), not to mention Latin (*via Appia*, etc.).

[4] Bibliographical and other details in Untermann (2000: 139).

[5] Omission of preconsonantal nasals: Buck (1928: 70).

[6] The Umbrian sequence <**-ie-**> no doubt reflects [-iye-], despite the spelling with single <**i**>; see Buck (1928: 28) on U. <**vi**> plus vowel for [wiyV] (U. **via** 'way', **arvia** 'grain', etc.) vs. <**vii**> plus vowel.

'auspice-taking' equivalent to an adj. 'augural'. Somewhat differently, the word could have been formed productively via the "official" suffix *-āto-* (as in U. *fratrecate* 'office of *fratrex*', *maronatei* 'office of *maro*')[1] affixed to a stem **awi(y)ĕk-* or **awi(y)ēk-*.[2]

2. 3. U. *auie*

There are two competing views about the morphology of *auie* (which in either version can be dat. or loc. sg.).[3] According to one conception, the word is a thematic neuter substantive **awi(y)o-* or an *ā*-stem feminine substantive **awi(y)ā-*. Alternatively, we might have a "5th-declension" *ē*-stem **awi(y)ē-*. The first of these is preferable, *ceteris paribus*, given the uncertain status of *ē*-stems in Italic in general and Umbrian in particular.[4] The *ē*-stem version is also unattractive in terms of the complex assumptions needed to account for the other material: thus, according to one unsatisfactory version,[5] the base form *auiē-* 'augury' is then extended by **-ko-*; **auiē-ko-* (allegedly with agentive meaning 'augur'), though itself unattested, then serves as the basis for denominative **aviekā-** and adjectival **aviekla** (i.e., **auiē-k-lo-*). Finally, the argument that U. **aviekate** and **aviekla** favor a 5th-declension interpretation of *auie*[6] is specious: especially given the relative opacity, synchronically, of **aviekate** and **aviekla** (2.1.), it may be equally attractive to view (New Umbrian) *auie* as back-formed to (Old Umbrian) **aviekla**, with the latter interpreted synchronically as **avie-kla-** (cf. **pihaklu** 'piaculum', **naraklum** 'narratio', etc.).[7]

2. 4. U. **aviekla** etc.

The morphology of **aviekla** is itself unclear, in part given its status as an adjective (as opposed to substantival forms like **pihaklu** etc., with **-klo-* < **-tlo-*). There are essentially two possibilities worth considering. First, according to Buck's tentative proposal,[8] **aviekla** could be "an adjective form of a noun **awiē-klo-*, formed from a denominative verb-stem **awiē-* (cf. U. *auie* 'augurio')". Alternatively, one could align the form with **aviekate**, by assuming a historical segmentation **aviek-la**. The two main variants of this second approach would be as follows:

[1] For this suffix see Buck (1928: 189).

[2] At least in terms of root and participial formation, a similar form may appear in Marruc. *auiatas* (MV 1), often interpreted as 'auspicatae'. But in fact the interpretation of this form is quite uncertain; see Untermann (2000: 137f., s.v.) and more recently Dupraz (2011: 194, with further references at 194n182).

[3] Detailed references in Untermann (2000: 138).

[4] Survey in Buck (1928: 132f.); in Umbrian, apart from *auie*, only **ri** (dat., abl. sg.)/*re* (abl. sg.) 'res' (for which a loan from Latin is not excluded; Untermann 2000: 635) and *iouie* (acc. pl.), *iouies* (dat. pl.) 'iuvenes [?]'. Much less likely as *ē*-stems are U. **kvestretie**, **uhtretie**; see Klingenschmitt (1992: 129f.) and Untermann (2000: 425, 787f.).

[5] von Planta (1897: 54f.).

[6] Thus e.g. Buck (1928: 132).

[7] I return below (2.4., directly following) to the question of the adjectival status of **aviekla** vs. instrument nouns like **pihaklu**, **naraklum**, etc.

[8] 1928: 183.

[9] Plain **-lo-* (as opposed to **-elo-*) is rare in Umbrian, but cf. U. **seples** 'fasteners' (III 17) < **sep-lo-*, in the analysis of Weiss (2010: 133). One could, following von Planta (1897: 27), suppose that **aviekla** is a secondary replacement of original "correct" ***avieçla**, remodeled with **-k-** after **avieka-**; but this is

(i) **awi(y)ĕ̆k-lo-* (with "agentive" **-lo-*, directly yielding an adjectival form)[1]

(ii) **awi(y)ĕ̆k-klo-*, with subsequent *k*-reduction[2] (as an adjectivized instrument noun).[3]

It is convenient at this point to take note of an orthographic (and phonological) feature shown by this form, namely the "Pleneschreibung" in the New Umbrian spellings *auiehclu* and *auiehcleir* (1.2. above): these spellings point to synchronic /*awi(y)ēk-*/, at least in this word. In fact, secondary medial lengthening (which may well be related to a secondary medial accent) is regular in Umbrian before "heavy suffixes", including **-klo-*.[4] This feature, together with the medial length-neutralization that is otherwise regular in Umbrian, means that both original **awi(y)ĕk-* and **awi(y)ēk-* remain possible, as also U. <**-ek-**>, <*-e(h)c-*> from diphthongal sources, e.g. **awi(y)aik-*, etc.

2. 5. *Preliminary overview*

The above material can be organized and interpreted in various ways; but the simplest set of descriptive assumptions for all three items, summarizing the above discussion, is as follows:

(i) a nominal basis ***aviek-** served as the basis for a denominative verb stem **aviek-a-**, as in **aviekate**[5]

(ii) the adjective **aviekla**/*auiecla* derives either from agentive ***aviek-lo-** or adjectivized ***aviek-klo-**

(iii) <**aviekla**> was reinterpreted as **avie-kla**, whence the new abstract *auie* (unless this is simply a neuter **awi(y)o-* or feminine **awi(y)ā-*)[6]

Points (ii) and (iii) are not essential for present purposes, since it is clear that the primary explanandum is the "**aviek-**" of **aviekate**; cf. de Vaan's succinct but telling notice of the form: "**aviekate** [dat. sg. f., analysis uncertain]".[7] To rephrase this in the bluntest possible way, we may say (probably echoing the conception of Umbrian native speakers, cf. 2.1.) that **aviekate** consists of **awi-* 'bird' followed by something else – but what?

3. Previous approaches to the problem

There are two conceivable approaches to the problem; both of them have been attempted in various forms, and will be assessed briefly in turn: (i) **aviekate** con-

an unnecessary complication, and not easy to accept in view of relatively frequent **-k-elo-* forms with palatalization (**tiçlu**, **struhçla**/*strusla*, **arçlataf**, etc.).

[2] On *k*-reduction in such forms, see Nielsen (2004).

[3] Secondary adjectival behavior of instrument nouns in **-tlo-* (> Lat. *-c(u)lo-* and, with dissimilation, *-cro-*) is rare, but attested early for Latin (Plautus, Cato): e.g. *lūdicrum* 'plaything, sport' (Cat. 61.24), but *artem lūdicram* (Pl. *Aul.* 626); *lābrum ēluācrum* 'basin for rinsing-out' (Cato *Ag.* 10.4). Such a development (as if *augurāculum* → adj. **augurāculus*, in the limited toponymic contexts in question, e.g. *Via *Augurācula*) is thus quite thinkable for Umbrian, too.

[4] See on this pattern Meiser (1986: 141ff.), Nishimura (2008: 214).

[5] Or alternatively, ***aviek-** → **aviek-** + "official" suffix **-āto-* (2.2. above).

[6] The "Pleneschreibung" treated in 2.4. indicates that in any case, the word <**aviekla**> was treated phonologically as if **avie-kla** (with synchronic length [awi(y)ē-kla-]) with "heavy suffix".

[7] 2008: 65.

sists of **awi-* 'bird' followed by a suffix formant (3.1.), or (ii) it consists of **awi-* 'bird' followed by another root (3.2.).[1]

3. 1. Neither of the existing versions of the approach "**awi-* 'bird' + suffix formant" is attractive, namely (i) **awi-* + suffix **-ēko-* (von Planta, Pisani, Ernout, Cerri), and (ii) *ē*-stem **awiē-* (2.3. above) + verbal suffix **-k-* (Devoto).

The first is little more than a descriptive rewriting of the problem, since a suffix '**-ēko-*' does not exist as such.[2] The second version is little better: there is virtually no evidence in Italic for a "verbal suffix **-k-*", beyond the alleged Oscan "*k*-perfect". Even if this turns out to be the correct analysis of the forms in question,[3] these do not match Devoto's **awiē-k-* in various significant respects,[4] and the comparison is thus without much value. In any case, as we have already seen, the existence of a basic *ē*-stem **awiē-* is far from certain in the first place.

This does not quite exhaust the possibilities for interpreting **aviek-** by means of a *k*-formant of some kind. One might think, for example, of a derivation **awi(y)-ek-*, with suffixation of the type seen in a number of Latin forms in nom. sg. *-ex*, gen. sg. *-icis*.[5] But quite apart from the notorious difficulty in interpreting the original vocalism of many such forms (some actually from **-ak-* or **-ik-*), this is not a promising approach for U. **aviek-** (where, given the lack of vowel-weakening in non-labial contexts, one must in fact operate with a historical sequence **-i(y)-ek-*). To judge, at any rate, from the relatively abundant Latin data, there are precious few forms with *i*-stem basis; and in the clearest instance of this sort, the original *i*-stem (Lat. *imbri-* 'rain shower') seems to have developed, in the first instance, as a plain "*k*-stem" (**imbri-k-*), whence remodeled *imbrex* (gen. *imbricis*) 'gutter tile'. This might lead one to expect plain **awi-k-*, which is nevertheless unworkable for the Umbrian material. In any case, most of the actual Latin *ek*-stems, with the prominent exception of a few primary-looking deverbative forms[6] and a few forms based on inherited nouns or adjectives,[7] display a restricted semantic/referential profile typical of "substandard" language[8] and borrowed vocabulary.[9] None of this is attractive, of course, for a term belonging to the Umbrian Sakralsprache. A pre-form **awi(y)-ek-*, finally, might well pose phonological difficulties with regard to syncope. For example, nom. sg. **awi(y)ek-s* might yield [awyeks],

[1] I refer globally to Untermann (2000: 139, s.v.) for full bibliographical details concerning work cited below by author's name only.

[2] Lat. *(h)a(l)lēc* 'fish sauce' (certainly borrowed) and *vervēx* (stem *vervēc-*) 'wether' (with obscure morphological background) — the sole "*ēk*-stems" in Latin — provide a slender basis for such a theory.

[3] O. **kellaked** (Sa 10, 12), λιοκακειτ (Lu 39), and perhaps σακαρακιδ (Lu 23, 24), on which see most recently Willi (2010: 12f.).

[4] Thus *ā*-stem basis in **kella-k-**, λιοκα-κ-, σακαρα-κ- vs. **awiē-k-*, not to mention the "*ā*-inflection" of **avieka-** (which does not match any attested Sabellic perfect).

[5] See especially Ernout (1946: 133-63), Leumann (1977: 375), Weiss (2009: 306f.).

[6] E.g. *vortex*/*vertex* 'whirl' (← *vertō* 'turn'), perhaps *pōdex* 'asshole' if based on *pēdō* 'fart'.

[7] E.g. *dentex* '(kind of) porgy' (← *dēns* 'tooth'), nom. sg. *senex* 'old (man)' (cf. **sen-o-* 'old', and compar. *senior*).

[8] See on this point Weiss (loc. cit., n. 33), surveying Lat. *ek*-stems in terms of "Annoying animals", "(Embarrassing) body parts", and "(Worthless) plants and minerals and people".

[9] See on this point de Vaan (2008: 299), s.v. *imber.*

and oblique prevocalic forms with the shape **awi(y)ek-V* might yield **awyek-V*, whence presumably **awyk-V*, realized as [awik-V]. Surface **aviek-**, then, cannot be explained directly on the basis of either stem-form, and would have to be accounted for as a generalization based on a contamination or conflation involving [awyek-] X [awik-]. As unattractive as that may be, it cannot perhaps be ruled out; but given the other problems with this approach, one must be reluctant to accept an analysis via a *k*-stem without a great deal of reservation.

3. 2. The approach that assumes "**awi-* 'bird' + another root" seems *prima facie* more promising; but existing theories of this kind are problematic.

As for Brugmann's proposal of **awi-* 'bird' + Italic **aik-*, referring to PIE **Heyk̑-* 'acquire, possess'[1] and (given the Italic vocalism) assuming **h₂eyk̑-* (in contemporary notation): Untermann correctly points out that this is "semant[isch] unbefriedigend";[2] nor is this root otherwise attested in Italic at all. It hardly needs to be pointed out that the business of the ancient augur did not involve actual trapping or capture of birds, but rather, primarily, observing them and interpreting their signs ("omens").

By far the most popular version of this approach assumes a combination of Ital. **awi-* 'bird' and PIE **yek-* 'speak' (Meiser, Heidermanns, Schirmer),[3] cf. U. **iuka** 'words (of a prayer)', Lat. *ioca* 'jokes'. To be sure, **awi-* + **yek-* (or, according to another variant, **awi-* + **yēk-*) yields an attractive formal similarity to **aviek-**/ *auie(h)c-*; but this may be little more than a superficial resemblance, given various problems that attend this theory. To begin with, the semantics are not much better than **awi-* + **h₂eyk̑-*: there is little reason to believe that terminology designating an 'auspice-taker' – a figure whose primary function was the observation of birds (and interpretations based thereon) – would derive from meanings like 'bird-caller', 'bird-talker', 'bird-prayer', or even (as in Meiser's improved but still unacceptably complex version) 'bird-[observation-results-]announcer'. Moreover, both PIE **yek-* and **yēk-* are problematic from a formal point of view. The latter,[4] as Untermann correctly points out, is "ohne überzeugende Erklärung für die Länge des *ē*", there being no evidence that this root inflected as an acrostatic verb in PIE. And from the perspective of Umbrian phonology, a sequence **awi-yĕk-* poses precisely the same difficulty with regard to syncope already seen for **awi(y)-ĕk-* (3.1.). As in that case, **awi-yĕk-* may be difficult to rule out, as unattractive as it is in various respects. Still, there is sufficient uncertainty to authorize consideration of another possibility of the same general type, i.e. an original compound based on **awi-* 'bird' and another root.

[1] Thus *LIV* s.v. for the root shape (: Ved. *ī́śe* 'has at one's command', etc.).

[2] See also *LIV* (s.v. **Heyk̑-*, n. 1) on the difficulties in reconstructing the laryngeal color for this root.

[3] After Untermann (2000), also Heidermanns (2002: 192f.) and Martzloff (2006: 349).

[4] Defended by Meiser (1986: 146n1) as "etymologisch echt", at least as a possibility, for the *auiehc-* forms, though also admitting the possibility of a secondary lengthening related to accent (cf. 2.4. above on the "Pleneschreibung").

4. A new hypothesis

4. 1. The primary Latin comparandum for U. **aviek-** (including **aviekla** *'augury' → 'augural', and a probable verb stem **avieka-** 'take auspices') is *auspex* 'augur, soothsayer' and its derivatives, principally the denominative *auspicā-* 'take auspices' (both active and deponent) and the abstract *auspicium* 'augury, auspices'. *Ceteris paribus*, it is reasonable to suppose, moreover, that U. **avieka-** does indeed recover a denominative verb stem in *-*āye*/*o-*, exactly like Lat. *auspicā-* (i.e., rather than **aviek-** + "official" suffix *-āto-*, 2.2. above), and this is what we will assume in what follows. The essential point is that we are likely to have a compound of **awi-* 'bird' plus a root that means 'look at, observe', precisely as in Lat. *auspex* etc. (with 'bird' + Ital. **spek-* < PIE **(s)pek̂-* 'look at').[1] Or more specifically: **aviek-a-** may show the same structure as *au-spic-ā-*, but with a different root for 'look at' – and the only serious candidate, in view of its final (labio)velar, is PIE **h*$_3$*ek*^{w}- > Ital. **ok*^{w}-/**ok-*.

Thus for the general construct **awi-* + **ok*^{w}- '**awi-spek-*' > U. **aviek-**, there are two immediate problems, which we will take up in turn: (i) the delabialized labiovelar (4.2.), whence a surface velar stem in /-k-/ (in **avieka-**, **aviekla**), and (ii) the unexpected root vocalism of the second member (4.3.).

4. 2. The delabialization is easily dealt with, as it is virtually predictable: cf. U. *subocau* 'I invoke' < pre-U. **-wok-ā-ye*/*o-* (: **wek*^{w}- 'speak'); the velar stem has been generalized from a context like nom. sg. **wōk*^{w}*-s* > /wōks/ (with delabialization), similarly Lat. *vōc-* 'voice' (nom. sg. *vōx*) and (with the vocalism of the old oblique stem) denominative *vocāre* 'call'.

Theoretically, then, it would be perfectly in order to assume a basis in an Ital. **awi-ok*^{w}*-s*, whence a generalized stem **awi-ok-* (comparable to pre-Lat. **awi-spek-*) and denominative **awi(y)-ok-āye*/*o-*.

4. 3. Under such a hypothesis, however, the *e*-vocalism in U. **aviek-**/*auie(h)c-* remains difficult, and in fact, a starting point in PIE **h*$_3$*ek*^{w}- itself is probably unworkable.[2]

4. 3. 1. In the most direct way, one could suppose a development */awi(y)ok-/ > /awiyek-/, by a process of vowel-fronting conditioned by the preceding high vowel (and/or high glide). To this one may compare – but only very generally – the limited medial vowel-weakening in Oscan and Umbrian, with assimilation in labial environments (O. **prupukid** < **prō-pak-*, U. **prehubia** ~ **prehabia**, etc.),[3]

[1] Cf. von Planta (1897: 55): "Es bleibt daher die Frage offen, ob nicht in *aviēk-* etwa ein Compositum stecke wie in l. *au-spic- au-gur-*" (although he did not specify the second member, and suggested that *aviē-* in this case might be the dat. sg. of an *o*-stem *auio-*). The possible morphological correspondence between **aviekla** and Lat. *speculum* 'mirror' (whichever version of the suffixation one prefers for both, cf. 2.5.(ii) above and Nielsen 2004: 195 on *speculum* < **spek-klo-*) is suggestive, but is not crucial for anything that follows.

[2] I am grateful to Michael Weiss for helpful discussion of the material in this section.

[3] Buck (1928: 56f.), see more recently Nishimura (2008: 160).

or (somewhat more appositely) the post-yod fronting seen in SPi. *o*-stem dat. sg. forms, of the type **kaúieh**, **rakinevií**.[1] Ultimately, however, this approach is unsatisfactory: there is no other Umbrian example of this type of vowel-fronting (a rare process, in any case), which renders this hypothesis entirely ad hoc.

4. 3. 2. One could also consider the development of a sequence */awi(y)ok-/ in terms of Sabellic syncope patterns. But the result is similar to what was already seen for */awi(y)ek-/ above (3.2.). Thus, nom. sg. /awiyok-s/ should yield /awyoks/, beside prevocalic oblique /awyok-V/ > /awyk-V/, probably realized as [awik-V]. Based on these results (i.e., with alternating /awyok-s/ ~ /awik-V/), one could perhaps imagine a "compromise" stem /awyik-/, which might have been realized as [awyek-], on the basis of which one might at least approach an explanation for the surface spelling **aviek-**. Even if, as we shall see below, a development [-yik-] > [-yek-] may itself be acceptable, there are too many uncertainties for this sort of approach to be attractive.

4. 3. 3. In the absence of workable internal analyses, one could seek external support for *e*-grade /awi(y)ĕk-/, which could conceivably be found in Celtic: cf. the *e*-grade (as if from a root or root-variant "**h₁ek^w-*") in the second member of the compound appearing in OIr. *enech* (Og. *Ineqa-*), W. *wyneb*, Bret. *enep* 'face'.[2] Such forms may somehow belong with **h₃ek^w-* itself,[3] or may point to a variant **h₁ek^w-*; but there is no other evidence in Italic for material of this kind, and in any event, given the unclear background of the Celtic forms, this would amount to a case of *obscurum per obscurius* (in addition to the syncope problems a sequence /awi(y)ĕk-/ might entail, as already noted in 3.1. and 3.2.).

4. 3. 4. Finally, turning to PIE itself, one could consider a starting-point in an acrostatic **h₃ēk^w-*, under the assumption that the Umbrian material reflects /awi(y)ēk-/. But there is no real evidence of acrostatic behavior for this root,[4] which again renders this approach ad hoc and therefore devoid of much explanatory value.

4. 4. The dilemma at which we have arrived can be rephrased as follows: Ital. **awi-* + PIE **h₃ekw-* may somehow underlie U. **aviek-**; but **h₃ek^w-* itself – with the utterly intractable *o*-vocalism it would produce – is unworkable (4. 3.). A solution, then, begins from the sole form of PIE **h₃ek^w-* that would *not* yield *o*-vocalism, namely the reduplicated desiderative stem **h₃i-h₃k^w-(h₁)s(e/o)-* (> Ved. *ī́kṣate* 'looks at, imagines'). Such an account, *in nuce* (with further details immediately following), would begin from an Italic compound **awi-īks-* (with the meaning and formation of Lat. *auspex*), reanalyzed as **awi-īk-*; this form then undergoes a high vowel dissimilation to yield **awi-ēk-* (> U. **aviek-**/*auie(h)c-* directly).

A compound root noun pre-U. **awi-īks-*, comparable in formation to pre-Lat. **awi-spek-*, would have a nom. sg. **awi-īks-s.* Such a form would be expected to undergo *s*-degemination, creating the conditions for a reanalysis as nom. sg. **awi-*

[1] See on this process Weiss (1998: 707f.).
[2] This suggestion was offered to me purely *ex hypothesi* by Alan Nussbaum.
[3] See *NIL* 372, 380n63 (with references).
[4] Av. *aiβii-āxšaiia-* 'watch' is probably not to be interpreted in this way; see *LIV* s.v. **h₃ek^w-*.

īk-s, whence a remodeled stem **awi-īk-* → gen. sg. **awi-īk-os*, etc. (for original **awi-īks-os*, etc.). Other factors, in addition to the *s*-degemination, might have supported the development of a stem **awi-īk-*: there is, for example, a series of Umbrian root formations with velar stems,[1] as well as suffixed formations;[2] and one might also point to the general absence of consonant-stems in stem-final /…ks-/.[3] If, moreover, Sabellic inherited verbal **īks-e-tor* (: Ved. *ī́kṣate*), this might inevitably have been interpreted as a future **īk-se-tor* (cf. Sabellic *s(e/o)*-futures: U. **ferest**, O. **fust**, etc., with syncope), whence a back-formed present stem **īk-*.

The immediate treatment of the resulting **awi-īk-* can be conceived of in different ways. It is simplest to assume that the compound would have been retained as such. Alternatively, the sequence might initially have undergone a phonologically regular contraction to **awīk-*; but even in that case, one would probably expect the form to have been rederived as **awi-īk-*, thus maintaining the salience of **awi-* 'bird' and the sense of the form as a compound, perhaps further supported by the existence (at least at an early stage) of verbal **īk-* (cf. above).

Finally, from the point of view of low-level phonetics, a compound **awi-īk-* (perhaps phonetically [awiyīk-], with transitional glide) might well have undergone dissimilatory vowel-lowering, i.e. **awi(y)īk-* > **awi(y)ēk-* (or, if this occurred after the Umbrian medial length-neutralization, **awi(y)ik-* > **awi(y)ek-*). There is in fact relatively abundant evidence for such a process elsewhere in Italic, as in the following:

(i) Lat. **-i(y)ī-* > /-i(y)ē-/: *aliēnus* 'of another', *lanīēna* 'butcher shop' (< **-i-īno-*);[4]

(ii) Latin secondary **-i(y)V-* (for V = vowels susceptible to weakening in medial open syllables) > /-i(y)e-/, not /-i(y)i-/: e.g. **-i(y)o-tāt-* > /-i(y)e-tāt-/ (*societās* 'fellowship', *pietās* 'sense of duty', etc.), **pari-itis* > *parietis* 'wall' (gen.);[5]

(iii) OLat. ADIESE 'adiisse', ADIESET 'adiisset', ADIESENT 'adiissent' (SCdB), similarly INTERIEISTI 'interiisti' (CIL I² 1603);[6]

(iv) Oscan gentilicia in (nom. sg.) **-iís**/*-ies*/*-ιες* (beside **-iis**) (< **-iyis*).[7]

There is thus little difficulty in assuming **-i(y)ī-* > /-i(y)ē-/ or **-i(y)i-* > /-i(y)e-/ for Umbrian as well.[8]

[1] U. *pase* (: Lat. *pāx*), *frif* (: Lat. *frūgēs*), as well as the presumed Umbrian equivalent of Lat. *vōx*, whence the velar (vs. labial) in *subocau* (cf. 4.2. above). (The status of U. *suboco* as a consonant-stem is uncertain; see Untermann 2000: 708.)

[2] U. *curnaco*, *curnase* 'crow' (cf. Lat. *cornīx*), as well as the vessel term **skalçeta**, *scalseto*, *scalsie* (cf. Lat. *calix*).

[3] The closest thing to this might be the *i*-stem Lat. *axis* 'axle', which may go back to an older root noun **h₂eḱs-* (see *NIL* 260).

[4] Thus traditionally, e.g. Leumann (1977: 54); differently for *aliēnus*, as a possibility: de Vaan (2008: 34 with references), Weiss (2009: 289n120).

[5] Leumann (1977: 90), Weiss (2009: 119, 122), Gerschner (2002: 109, for *pariet-*). Compare also the /-yi-/ > /-ye-/ dissimilation in forms of *iaciō* with reintroduced /-y-/ of the type CONIECIANT (and other such forms attested in the literary tradition), on which see recently Weiss (2009: 119, 154f.).

[6] Explicitly identified as dissimilatory by Leumann (1977: 51) and Weiss (2009: 429n20).

[7] Buck (1928: 123), Meiser (1986: 65), cf. recently Nishimura (2009: 171n26).

[8] Although the issue cannot be pursued here, it seems attractive to assume that this process would

5. SKT. *ĪKṢ-* AND PRE-U. **-ĪK-* (← **-ĪKS-*)

Several points deserve brief mention in connection with Ved. *ī́kṣate* and its usage.

5. 1. Note, first of all, that Skt. *"īkṣ-"*, despite its historical formation as a reduplicated "desiderative" (< **h₃i-h₃kʷ-(h₁)s(e/o)-*), is for all intents and purposes, from the Indic point of view, a root, with a basic meaning (on the order of 'observe', see further below) that lacks desiderative function entirely.[1] There is thus little difficulty in assuming the same for an Ital. **īks(e/o)-*. Alternatively, it remains possible that Ital. **īks(e/o)-* maintained, as an archaism preserved in such a *terminus technicus*, some sort of desiderative sense: this would after all be eminently appropriate to the context of augury, where skilled officials are 'seeking to observe', 'trying to observe', 'intent on observing', etc.

5. 2. As an interesting parallel to the Umbrian specialization involving augury, the semantic range of Skt. *īkṣ-* in post-Vedic literature includes 'observe (the stars)', and hence 'foretell'. This may be little more than a typological parallel, as this sense is attested relatively late, as in treatises like Varāhamihira's *Bṛhat-saṃhitā* (6th c. AD),[2] and in a late example appended to Pāṇini 1.4.39 (*yajñadattāya īkṣate* "foretells for Y.", i.e. "looks into Y.'s horoscope").

5. 3. But the usage of the word in earlier periods is potentially more interesting. For Veda and Brāhmaṇa, one can consult the detailed study of desiderative stems by Heenen, who has surveyed the more than 600 attestations of this verb in early texts.[3] Particularly suggestive is a prominent Brāhmaṇic usage in which the visual act, in a sacrificial ceremony, induces a particular thought, as in the following passage:

yárhi hótéḍām upahváyeta tárhi yájamāno hótāram ***ī́kṣamāṇo*** *vāyúm mánasā dhyāyet* (TS 1.7.1.2)
"Lorsque l'Hotar annonce l'Iḍā, le Yajamāna **regardant** alors l'Hotar doit avec sa pensée imaginer Vāyu." (transl. Heenen)

The act of observation is linked, in such ritual contexts, with an inner act of thought or imagination, often focusing on a divinity or some other aspect of a ceremony.[4] In a general way, this is not unlike the augur's "observation" of birds

have been more natural phonetically if at least the second /i/ (or /ī/) was unaccented (and possibly blocked if accented: cf. *píetās* vs. *piíssimus* [on which see Leumann (1977: 90)], although the latter is of course easily explainable as analogically restored after productive *-issimus*). If so, forms like *laniēna* (and possibly also traditional spellings like ADIESE) could go back to the period of initial stress (**lánīina* > *lániēna*), a type of stress format that is available in principle for U. **avieka-** as well.

[1] Cf. *LIV*: "Keine desiderative Konnotation mehr erhalten, schon als Neowurzel *īkṣ* etabliert, vgl. z.B. Kaus. *īkṣáyat* RV".

[2] Cf. also *īkṣaṇika-* 'fortune-teller' in Varāhamihira.

[3] Survey of attestations by Heenen (2006: 82-88); see especially his analytical discussion (2006: 56f., 88f.).

[4] For *īkṣ-* explicitly linked with 'thought' (in addition to vision), cf. also AV-ś 2.34.3b *anvaíkṣanta*

and their omens, which *per definitionem* involves an associated act of interpretive imagination in a religious context.

6. On verbal *H_3EK^w- (and *s*-present / desiderative *H_3EK^w-*s*- / *H_3I-H_3K^w-(H_1)*s*-) in Italic

Naturally, the above proposal would be more attractive if it were possible to adduce independent evidence for the verbal root *h_3ek^w- in Italic, and in particular one or another of its verbal *s*-forms. As is well known, Italic generally makes use of other roots for 'see' and related concepts (cf. Lat. *vidēre*, *observāre*, *spectāre*, *contemplāre*, *tuērī*, U. **terkantur**, etc.), and indeed, no Italic verbal material at all is registered s.v. *h_3ek^w- in *LIV*. Nevertheless, some Italic nominal forms may provide indirect evidence both for verbal *h_3ek^w- and possibly even *s*-present *h_3ek^w-*s*-.

6. 1. Several forms are highly uncertain or otherwise unusable, and can be dealt with briefly. Thus, to begin with, SPi. **oftorim** (CH 1A) may have a synchronic meaning like 'monumentum', according to one interpretation, and has been interpreted etymologically as *ok^w-*e*-*tor*-*yo*- 'spectatorium';[1] according to a different interpretation (based on the same etymology) – and one potentially interesting in the present context – the word may mean 'auguraculum'.[2] But the context is far from transparent; even if a sense like 'monumentum' (or even 'auguraculum') turns out to be accurate, this etymological account, given the current state of our ability to understand this text, is little more than a guess.[3]

In a similar way, Watmough[4] has sought to etymologize U. **uhtur** (the public official usually conceived of as *'auctor'*) in terms of a Pr.-Sab. **of*-*tor*- 'over-seer', based on *h_3ek^w- 'see' and to be compared not only with SPi. **oftorim** but also the gentilicium Pael. *ofturies*. Beyond the uncertainties surrounding the South Picene form, the weaknesses of this approach (and the superiority of the traditional account of U. **uhtur**) have been discussed elsewhere, and need not be rehearsed here.[5] Somewhat more attractive, though still uncertain, is the possibility (discussed recently by García Ramón 2012) that the Latin gentilicia *Opsturius* and *Ostorius* (both probably reflecting the same name) are based on an agent noun *h_3ek^w-*s*-*tōr*, to the *s*-present stem *h_3ek^w-*s*- (discussed further in the next section).

Likewise uncertain is the suggestion that O. **aftiím** (Cm 13), a physical or mental characteristic of an individual to whom a curse is directed, belongs somehow with *h_3ek^w- 'see'.[6] The uncertain background of this form, as well as the possibly comparable *-af*- of the theonym or divine epithet Vestin. *comaftas* (*CIL* IX 3556), have recently received a thorough commentary by Dupraz.[7]

mánasā cákṣuṣā ca 'they (= the sacrificers who) looked after (him = the sacrificial animal) with mind and with eye', cited by Heenen (2006: 88n56).

[6] References and alternative theories in Untermann (2000: 60, s.v.).
[7] 2010: 314ff.

Lat. *oculus* 'eye' clearly does have a source in PIE **h$_3$ek^w-*, but here there are morphological indeterminacies. In theory, this could be a deverbal agentive of the type *bibulus* 'tending to drink' (: *bibō* 'drink'), *crēdulus* 'tending to believe' (: *crēdō* 'believe'), etc.[1] But it is hard to exclude a basis in the root noun **h$_3$ek^w-* 'eye', also found in the second member of original compounds like *ferōx* 'savage' (< *'wild-looking'), *ātrōx* 'black' (< *'burnt-looking').[2]

6. 2. Much more promising, for our purposes – in part for obvious semantic reasons – is Lat. *ōmen* 'omen, augural sighting'.[3] The background of this word, to be sure, is famously controversial. In addition to the older etymological dictionaries, one may now consult de Vaan (2008: 427f.), who reviews more recent problematic theories that need not be evaluated here.[4] By far the simplest and most attractive account (favored also by de Vaan) begins from an Italic **ok^w-s-mn̥* 'sighting, observation', to PIE **h$_3$ek^w-* 'see, observe'.[5] The suffixal morphology can be interpreted in two ways. It is possible, first of all, that we simply have the normal *s*-extended formant *"*-smn̥"* that is commonly used by Latin for roots ending in velar,[6] as opposed to plain **-mn̥* (as in Gk. ὄμμα 'eye').[7] But it is equally possible (as de Vaan prefers) that **ok^{w}s-* continues the *s*-present stem of **h$_3$ek^w-* (cf. *LIV* s.v.), as in Gk. ὄψομαι 'see', Av. *aiβii-āxšaiia-* 'watch'. And while *"*-smn̥"* (whence Lat. *"-smen/-smentum"*) is commonly interpreted as a development based on original *s*-stems,[8] part of the input for this phenomenon can certainly have included deverbal *men*-stems based on original *s*-presents. De Vaan hesitates to accept the deverbal interpretation of *ōmen*, however, for the following reason: "The only drawback is that the suffix *-men* nearly exclusively occurs after Latin verb stems or verb stems of an earlier period. For **h$_3$ek^w-* 'to see', we have no evidence in Latin that a verb existed." This drawback would be considerably mitigated if in fact U. **avieka-** contains (a version of) the PIE verbal root **h$_3$ek^w-* 'see', a consideration that might also favor the assumption of an *s*-present source for Lat. *ōmen*, as opposed to a

[1] For this interpretation, see Leumann (1977: 311); cf. de Vaan (2008: 425), allowing (among several possibilities) that the word "could be derived … from an earlier verb".

[2] For the root-noun-based account of *oculus*: Nussbaum *apud* Weiss (2009: 195n9), with the suggestion that *oculus* reflects a back-formed masculine to the inherited dual.

[3] On *ōmen* and augury: "*omen* velut oremen, quod fit ore augurium, quod non avibus aliove modo fit" (P.F. 213L).

[4] In particular: **h$_2$e/oh$_3$-s-mn̥* 'trust', cf. Hitt. *hā-^{zi}* 'believe, trust' (Benveniste, Oettinger); **h$_{1/2}$oĝ-s-mn̥* 'speech', cf. Lat. *aiō* 'speak' etc. (Meier-Brügger).

[5] Cf. Varro's *osmen* (*L.* 6.76, 7.97); although often doubted because of the apparent folk-etymology via *ōs* 'mouth' (cf. Festus on *ōmen*, n. 3 above), the form may well be entirely accurate, and thus comparable to other forms with *-sm-/-sn-* in the early grammatical tradition (with *-sm-*: e.g. *dusmo*, P.F. 59.3L [Liv. Andr.]), some of which are surely genuine (e.g. *cesna/cesnas*: Fest. 222.26L, 228.10L); cf. also TRIRESMOS (*CIL* I^2 25.10) and Praen. LOSNA (*CIL* I^2 549), both no earlier than the third century (though conceivably already archaizing).

[6] See Leumann (1977: 370f.) on Lat. (velar +) *-smen/-smentum* (directly attested in For. Inscr. IOVXMENTA '(yoked) draft animals').

[7] A connection with the *s*-formant of Ved. *akṣ-* 'eye' is unlikely; see *NIL* 375.

[8] Thus for **yeug-s-mn̥* (cf. IOVXMENTA/Cl. *iūmenta*, n. 6), cf. **yeug-es-* in Lat. (neut. pl.) *iūgera* (land measure), Myc. (dat. pl.) *ze-u-ke-si* (Hom. ζεῦγος), among other possible *s*-stem reflexes. (See, however, *NIL* 401 for a different conception of the background of the Latin material.)

basis in the complex formant "**-smn̥*". It is thus entirely possible that Proto-Italic inherited both (*s*-present) **h₃ekʷ-s-* and (desiderative) **h₃i-h₃kʷ-(hₓ)s(e/o)-*; cf., for example, **tekʷ-s-* beside **ti-tkʷ-(hₓ)s-* (: **tekʷ-* 'flow') in Celtic.[1]

7. Conclusion: how to observe a bird in Proto-Italic

If something like the above proposal is correct, it may have interesting implications for the reconstruction of Italic sacral diction and phraseology, including shared habits of expression ("strategies of translation", *sensu lato*) between closely-related cultures.

7. 1. An essential descriptive fact is that the augural terms Lat. *ōmen* and U. **avieka-**/**aviekla** are both isolated within their respective (Latin and Sabellic) traditions.[2] It follows, then, that these terms may preserve the truly archaic augural diction in Italic, consisting of **awi-* 'bird' and the Italic avatars of *s*-present **h₃ekʷ-s-* and desiderative **h₃i-h₃kʷ-(hₓ)s(e/o)-*. This, in turn, would mean that other usages, even though relatively old and part of the shared heritage of both traditions, could well be essentially neologistic:

(i) via PIE **spek̂-*: U. **speturie** and **speture** (1. 1. above), pre-Lat. **awi-spek-* (cf. **χaru-spek-* 'exti-spic-' > Lat. *haruspex* 'diviner [via observation of internal organs]'), Lat. *spectiō* 'augural observation'.[3]

(ii) via other verbs, especially based on **serwo-*: U. **aves: anzeriates** etc. (2. 1. above); Lat. *servāre* 'observe (heavenly signs)'.[4]

Indeed, given circumstances in which the original phraseology has become opaque (as has clearly occurred in this case in both Latin and Sabellic),[5] lexical replacements like these are entirely predictable. The evident methodological corollary is that the Latin-Sabellic correspondences in (i) and (ii) – as archaic as they may be and as interesting as they certainly are in terms of shared cultural and thus lexical/phraseological patrimony – may well be *Scheingleichungen*: in terms of the reconstruction of the Italic Sakralsprache inherited by Sabellic and Latino-Faliscan, these correspondences may reflect a superficial layer of replacements (whether they arose independently or via borrowing) that may give a false picture, as opposed to the more deeply embedded phraseology involving 'bird' and *s*-forms of **h₃ekʷ-* hypothesized above.

[1] The larger problem of the morphology of PIE desideratives (including, in particular, relationships that may have existed between *s*-presents and desideratives) lies beyond the scope of this paper. For a survey (with rich bibliography) of various positions on PIE desideratives, see McCone (1991: 137ff.), and for an important sketch of PIE *s*-present and desiderative morphology, see Jasanoff (1988: 232ff.). More recently on Italic verbal *s*-formations: de Melo (2007, passim), Nussbaum (2007).

[2] For the relative synchronic opacity of the latter, see already 2.1. above.

[3] Lat. *spectiō* in this sense: e.g. Fest. 446.13L, Cic. *Phil.* 2.81, Varro *L.* 6.82.

[4] *OLD* 2b; further *secundam … avem servat* (Enn. *Ann.* 74-5 Sk), *de caelo servare* (Cic. loc. cit. [n. 3] and elsewhere, cf. the augural formula *ne quis magistratus minor de caelo servasse velit*, Gell. 13.15.1), *servantur auspicia* (Varro *L.* 5.33), etc.

[5] For Lat. *ōmen*, note the folk-etymological tradition associating the word with *ōs* 'mouth' (295 nn. 3, 5 above).

7. 2. It may be helpful, by way of conclusion, to summarize in schematic form the sequence of developments that seems most likely for the Umbrian forms in question (with comparative notes on Latin):[1]

(i) formation of an agentive compound (pre-U.) **awi-īks-* 'auspex' (< PIE **h₂ew-i-* 'bird' + desiderative stem **h₃i-h₃kʷ-(h₁)s-* of **h₃ekʷ-* 'see')

(ii) **awi-īks-* remodeled to **awi-īk-*[2]

(iii) **awi-īk-* undergoes high-vowel dissimilation, resulting in **awiēk-*[3]

(iv) Umbrian medial shortening results in **awiek-* (as in the denominative stem **awiekā-* > **avieka-**), but pre-suffixal lengthening (perhaps with secondary accent) yields **awiēk-* in the **-tlo-* (> U. *-klo-*) formation **awiēk-klo-* 'auspicium; auguraculum'

(v) by this time (if not already by (iii) or (iv)), the archaic compound underlying **awiek-* and *awiēk-* is no longer transparent, whence alternative expressions such as those using **awi-* + derivatives of **serwo-*[4]

(vi) **awiēk-klo-* undergoes *k*-reduction; at this stage or earlier, **awiēk(k)lo-* in the sense 'auguraculum' develops adjectival behavior in limited contexts, whence **aviekla**/*auiecla*, *auie(h)clu*, etc.[5]

(vii) at any point after the original sense 'auspicium' (of **awiēk-klo-*) is lost as such, but probably at some point after *k*-reduction, a new abstract with this meaning (attested only in New Umbrian) is formed, in one of two ways:

(α) **awi-* 'bird' → **awi-yo-* [neut.] or **awi-yā* [fem.] 'the bird-related thing/activity', i.e. 'augury', or

(β) **awiēklo-* is interpreted as *"*awiē-klo-"* to provide, via back-formation, a new *ē*-stem abstract *auiē-* 'augury'.[6]

[1] It should be understood that the relative chronology of some of the items below cannot be specified with certainty.

[2] If **awi-īks* or **awi-īk-* developed to **awīk(s)-* (by regular contraction): **awi-īk(s)-* is rederived as a compound.

[3] Alternatively, this dissimilation could have occurred later, after the Umbrian medial length-neutralization.

[4] Similarly for Lat. *ōmen*, with 'see' already opaque by the *"ōsmen"* stage, whence *avi-* + *spec-*, *(ob)servā-*, etc.

[5] 'Augural Way' = the way to/from the *auguraculum*, 'Augural Stones' = the stones setting the boundaries of the *auguraculum* (vel sim.).

[6] This paper has benefited greatly from comments by George Dunkel, Benjamin Fortson, Werner Knobl, Craig Melchert, Alan Nussbaum, and Michael Weiss; sincere thanks to all.
