Foreword

Not many years after the publication of the Lapis Satricanus, I began to undertake the task of preparing a handbook of Archaic Latin inscriptions, as a replacement for the epigraphic portion of Ernout's serviceable (but by then seriously outdated) *Recueil de textes latins archaïques*. Especially with the publication of the fourth fascicle of CIL I^2 (1986), the time seemed ripe to consolidate, in a convenient and accessible format, a collection of the essential documents, provided with linguistic and bibliographical commentary. But as the work progressed, the commentary began to swell beyond any seemly bounds for such a manual, overburdened with what seemed to me to be necessary (and necessarily lengthy) explorations of a number of unresolved problems of language and paleography in these texts. Eventually, it seemed advisable to jettison these extended discussions from the commentary, and to prepare them for separate publication in the form of the present *Studies in Archaic Latin Inscriptions,* with the handbook proper to follow as soon as is practicable.

When the work for this project was at a relatively advanced stage, I became aware (through the kindness of Professor Klaus Strunk) of the publication of Rudolf Wachter's important monograph *Altlateinische Inschriften: Sprachliche und epigraphische Untersuchungen zu den Dokumenten bis etwa 150 v. Chr.* (1987), which regrettably made its way to American university libraries at the leisurely pace all too common for many European publications. Wachter's Herculean efforts in assembling and commenting on the Archaic Latin inscriptional material have naturally facilitated my work to a significant degree (even if some of my favorite "discoveries" turned out to have been preempted), and his work now provides a convenient reference point for the discussion of many (if not most) of the issues addressed in these *Studies,* and no doubt in future works on similar subjects. As for other bibliography: those familiar with the subject will appreciate the daunting task of reviewing the mountains of relevant scholarly literature, but an earnest attempt in that direction was made nonetheless; inevitably, several recent works of some importance reached me too late to be incorporated more than superficially, or at all.

I am happy to acknowledge the support of a Morse Foundation grant for the portions of the work conducted while at Yale University, where the encouragement of my colleagues Victor Bers, George P. Goold, and Heinrich von Staden was especially meaningful to me. Completion of the project was ensured by a grant from the Princeton University Committee on Research in the Humanities and Social Sciences, which provided me with the invaluable assistance of Mr. Mark Southern during the spring and summer of 1992. Material from Chapters 1, 2, 8 and 11 was presented at the Fifth, Ninth, and Eleventh East Coast Indo-European Conferences (1986, 1990, 1992); the participants of these august gatherings reacted with their customary erudition, generosity, and congeniality, all of which is most sincerely appreciated. Most of the manuscript was read in draft form by Brian Joseph and Rex Wallace, whom I thank most gratefully for their kind assistance in improving the text; in particular, the latter's consummate control of the Archaic Latin, Italic dialect, and Etruscan material helped guide my thinking on a number of points, and saved me from several blunders thankfully known only to him. Neither scholar, of course, can be held responsible for any remaining deficiencies. For technical help in preparing and printing the final text, I am greatly indebted to Mary Albert and David Herrington (Computer and Information Technology, Princeton University). Finally, I wish to thank Professor Wolfgang Meid for his willingness to include this work in the Innsbruck series, and for his patience and guidance throughout the project.

Princeton, September 1992 Brent Vine

Contents

Foreword 5
Bibliographical Abbreviations 11
Notational Conventions 23
Introduction 25

PART ONE: *STUDIES IN INSCRIPTIONS*

Chapter 1: *The Forum Inscription* 31
1.1 On Deviations in the Direction of Writing 31
1.2 Excursus: On the Direction of Writing in CIL 5 35
1.3 On the "Inverted" Lines 37
1.4 **recei** (5), **quoi** (1), **m:ite** (12) and the Structure of the Text 41
1.5 **sor[-][, sorḍ[** etc. (3) 50
1.6 **:kapia:d-** (11) 55
1.7 **loi{ụ}quiod** (16) 58

Chapter 2: *The Corcolle Altar Fragments* 65
2.1 Introductory 65
2.2 B1 + C1 and A2 (Preliminary Considerations) 67
2.3 On Spacing and the Restoration of B1 + C1 70
2.4 Problems in the Reading and Interpretation of B4 + C4 75
2.5 Further Notes on A2 and the Nature of the Text 79

Chapter 3: *Inscriptions from Latium* 85
3.1 Notes on the Tibur Pedestal Inscription (CIL 2658) 85
3.2 "Itacismus" and Related Problems in CIL 610 and 37 95
3.3 CIL 34 105
3.4 Marginalia to CIL 549 **Losna** (I): On **-sN-* Clusters in Latin and Italic 116
3.5 Marginalia to CIL 549 **Losna** (II): Lat. *mōnstrum, lūstrum* and Secondary Instrument-Noun Formations 122
3.6 Marginalia to CIL 549 **Losna** (III): Etruscan *tusna* 130

Chapter 4: ***Inscriptions from Oscan- and Umbrian-Speaking Areas*** 133
4.1 On "Oscan Influence" 133
4.2 CIL 2489 134
4.3 Notes on the Paleography of Campanian Inscriptions 142
4.4 CIL 3121 **nocerei** 147
4.5 On Some Monophthongizations of **ai* and **au* in Inscriptions from Umbria and the North Coastal Area (CIL 3292a, 3374, 1899) 150
4.6 CIL 382 154
4.7 CIL 1926 157

PART TWO: ***STUDIES IN GRAMMAR AND ORTHOGRAPHY***

Chapter 5: ***"Mircurios" and Related Problems*** 161
5.1 Introductory 161
5.2 Praen. **Mirq-** (CIL 553)/**Mirc-** (564) vs. **Merc-** (563) and "Delian Latin" **Mirq-/Mirc-** vs. **Merc-** 163
5.3 CIL 2873b **Hircol**, 2890 **Mirc** 166
5.4 On the Dialect Geography of *erC* > *irC* 169
5.5 Excursus: CIL 563 **Mercuris** and **Iovos** 171

Chapter 6: ***Latin af*** 175
6.1 Introductory 175
6.2 **af** in the "Epistula ad Tiburtes" (CIL 586) 178
6.3 On Previous Analyses of **af** 180
6.4 Attestations of **af**: Survey and Conclusions 183

Chapter 7: ***The Thematic Ablative Singular*** 191
7.1 Introductory 191
7.2 Methodological Preliminaries: Prat's Inscriptional Corpus 192
7.3 Seventh- to Fifth-Century Evidence 194
7.4 CIL 2658 **pro()fileod** and *prō* + Ablative 195
7.5 Other Prepositions 197
7.6 "Instrumental" *mer(e/i)to(d)* 198
7.7 Adverbs in *-ē* 205

7.8 Other Inscriptional Data 211

Chapter 8: *The o-stem Nom. Pl. -e(i)s* 215
8.1 Introductory 215
8.2 Pronominal **eis, heis** etc. (I) 216
8.3 Distribution of (Nominal) **-e(i)s** Forms 217
8.4 Inner-Latin Explanations 221
8.5 **-e(i)s** as Inherited 223
8.6 Theories of Dialectal Origin 226
8.7 A New Dialectal Source 228
8.8 Excursus: Notes on the South Picene Inscription TE 2 230
8.9 **-e(i)s** and Non-urban Gentilicia: Further Considerations 234
8.10 Pronominal **eis, heis** etc. (II) 236

Chapter 9: *"Apollo"* 241
9.1 *Apollōn-* vs. *Apollĕn-/Apollĭn-* 241
9.2 *"Apollō"* and *"homō"* 243
9.3 Excursus: Latin *humī* and the Development of **m̥V* in Latin and Italic 246

Chapter 10: *On Orthographic Variation in CIL 584 (Sent. Minuc.)* 253
10.1 Introductory 253
10.2 "Arbitrary" vs. "Conditioned" Orthographic Variation (I): **n(e)i** 255
10.3 "Arbitrary" vs. "Conditioned" Orthographic Variation (II): **i(o)us-** 258
10.4 Archaizing "Corrections" (I): **infim-/infum-, pos(s)-** 259
10.5 Archaizing "Corrections" (II): **qu(e)i, d(e)ors-, su(r)s-** 261
10.6 Archaizing "Corrections" (III): **ib(e)i** 265

Chapter 11: *So-called "Accian" Geminatio Vocalium* 267
11.1 Introductory 267
11.2 Oscan Geminatio and Geminatio in Latin Names 274
11.3 Geminatio in Other Lexical Items (I): **aa, ee, oo, ii** 278
11.4 Geminatio in Other Lexical Items (II): **uu** 282

Chapter 12: *Ligatures* 287
12.1 Ligatures in Archaic Latin Inscriptions 287

12.2 Ligatures and Non-urban Palatalized Segments (I): Introductory (Pael. Ð, ... Lat.-Umbr. d); Praen. Ꞓ (CIL 60) and Campanian Lat. Ꞓ (CIL 400) 290
12.3 Ligatures and Non-urban Palatalized Segments (II): Lat. -NE and Pael. -N- 296

Chapter 13: *Word-Division at Line-End* 299
13.1 Introductory 299
13.2 Word-Division at Line-End in the Forum Inscription....301
13.3 "In Latere" Division....303
13.4 "Overhanging" Patterns 309
13.5 Notes on Critical Applications....311
13.6 "Anti-Syllabic" Division....315

Chapter 14: *Syllabic Notation* 323
14.1 Introductory: Chronology, Distribution, and Nature of the Data....323
14.2 Constraints on Vowel Quality and Position in the Word 326
14.3 Syllabic Notation in Initial Syllables....332
14.4 Syllabic Notation in Second Syllables....334
14.5 Final Remarks 341

Chapter 15: *Co-Occurring "II" (Cursive E) and "E"* 345
15.1 CIL 477 and Co-Occurring II/E....345
15.2 Co-Occurring II/E in CIL I²: Survey and Conclusions....347

Chapter 16: *"Complex" Punctuation* 351
16.1 Introductory 351
16.2 "Bina Interpuncta" and Verse-Dividing Punctuation....352
16.3 Complex Punctuation in Naming Sequences 354
16.4 Non-Latin Evidence (I): Faliscan....362
16.5 Non-Latin Evidence (II): Paelignian (Ve 213)....366
16.6 Excursus (Non-Latin Evidence (III)): Volsc. *toticu : couehriu : sepu* ("Tab. Veliterna", Ve 222.3)....371

Index of Cited Inscriptions....383
Index of Cited Literary Passages 395
Index Verborum 397

Bibliographical Abbreviations

The following lists all major works cited, as well as most articles cited in more than one chapter; citations of other periodical literature are abbreviated as in *Année Philologique*.

Collections of inscriptions (e.g. CIL, Degrassi *ILLRP* and *Imagines*, Ernout *Recueil*, Pisani *Lingue* and *Testi*, Pocc, Ve, etc.) are generally cited by inscription number, except for Warmington *Remains* (which lacks consecutive inscription numbers), cited by page number. Other works containing such collections (e.g. Agostiniani *Iscriz. parlanti*, Giacomelli *Lingua fal.*, Palmer *Lat. Lang.*) are also cited by inscription number, with other text explicitly marked "p(p).", in some cases with distinctive abbreviations (thus "Giac." for inscriptions, "Giacomelli *Lingua fal.*" for other cited text, similarly "Ve"/"Vetter"). All other references are to page numbers, except where noted via "§", indicating numbered sections or paragraphs (as notably for Wachter *Altlat. Inschr.*).

Agostiniani *Iscriz. parlanti* : L. A., *Le "iscrizioni parlanti" dell'Italia antica* (Florence 1982).

Notational Conventions

Transcriptions of inscriptional material from both Latin and the Italic dialects follow standard conventions[1] (or easily interpretable variations thereof), although the following specific points may be noted:

1. For ease of legibility, it has seemed preferable to use lower-case boldface type (**honce.loucom** etc., as in Ernout *Recueil*) instead of the more usual upper-case or small-capital notation (HONCE.LOVCOM etc.) for Latin inscriptions. Potential confusion with material from "native-alphabet" Italic texts (in Oscan, Umbrian, and Faliscan), i.e. those also generally rendered with lower-case boldface type, arises only rarely in practice (as with the Fal.-Lat. CIL 365, e.g. **3.3.d** below), and should occasion little difficulty. In discussions referring to actual letter forms, transcriptions using upper-case characters are sometimes provided for clarity.

2. Again for ease in reading, word division in texts using scriptio continua is generally indicated (thus **XX()YY**), as distinct from unpunctuated space (**XX YY**), and space with suspected missing characters or punctuation (**XX[-]YY**, **XX[.]YY**, etc.).

3. In addition to various letter forms provided with special descriptions, or letters designated via transparent terminology (e.g. "R with short tail", "curved S" vs. "angular three-stroke S", etc.), relatively frequent reference is made to the following characters:

"open A" =  (with right stroke) or  (with left stroke),
vs. "closed A" = A, unless  (with angled interior strokes) is specified.
"cursive E" =  (transcribed "II", cf. esp. Ch. **15**)
"cursive F" =  (transcribed "I'", cf. esp. Ch. **15**)
"closed H" =
"angled L" =

---

[1] For Latin, see e.g. E. Weber, *Epigraphica* 44 (1982) 149ff.

"slanted M" = /\ (vs. M = "upright M")
"inclined N" = / (vs. N = "upright N")

4. Ligatures (cf. esp. Ch. **12**) are specified with subscript connecting hooks in transcriptions, and in other discussions are referred to via expressions like "N+T".

5. Inscriptions cited in full are generally transcribed with *left margin* indentations faithfully recorded, within certain typographical constraints (see esp. **3.3.c-f** on indentation practices); letter sizes and line lengths could not be controlled with sufficient precision to guarantee accurate notation of right margins, except as noted for several texts.

6. For expository convenience (owing to differing treatments in cited secondary sources), some notational inconsistency in transcriptions involving <V> has been allowed to stand, in both the text (thus **iouesat** et sim. generally in Ch. **2**, vs. **iovesat** generally elsewhere) and the indexes.

7. All dates are B.C., except as noted.

Introduction

1. Even before reaching the end of the first sentence of the first chapter, every reader will discern the arbitrariness of the two-part division chosen for these *Studies* (Part I, "Studies in Inscriptions" and Part II, "Studies in Grammar and Orthography"): the "studies in inscriptions" are replete with discussions of grammar and orthography, and the "studies in grammar and orthography" address many problems — on occasion at some length — associated with individual inscriptions. Far from seeking to reveal or to insist on some significant dichotomy between the inscriptions themselves and the linguistic problems they present, I have chosen this somewhat sprawling format mainly to impose at least a modicum of expository convenience on texts and issues that refuse to be compartmentalized. After all, as with other forms of philology, it is the constant intersection of text-critical, grammatical, orthographic, paleographic, sociolinguistic, and still other considerations that defines part of the interest of this material. The relatively thorough sub-sectioning, cross-referencing and indexing provided below may go some distance, it is hoped, toward facilitating the assimilation of such disparate and apparently unstructured matter. But it may also be helpful to provide some preliminary orientation, by sketching some of the recurring issues treated in these *Studies.*

2. The varied provenience of Latin inscriptions from the Republican period renders them invaluable witnesses for the problem of distinguishing between so-called *sermo urbanus* and *sermo rusticus* — broadly speaking, one of the fundamental developmental factors in the evolution of the Latin language, and one that has assumed increasing importance in the past quarter-century or so, partly as a result of new inscriptional finds. At the risk of oversimplifying, I think it is accurate to say that over the course of this period of scholarship, a fairly consistent approach to this topic has developed that is particularly associated with the work of a number of Italian scholars: many publications by E. Campanile, M. Durante, R. Giacomelli, R. Lazzeroni, E. Peruzzi, P. Poccetti (among others) have made important contributions to the study of relationships between urban

Latin features and local speech forms, including the (non-Latin) Italic dialects. Some of the results of this work have been impressive, and form the basis of several of the essays below (as, for example, Lazzeroni's demonstration of the essentially "Italic" nature of the orthographic practice of "geminatio vocalium", explored in Chapter 11). Nevertheless, the generally salutary attentiveness to sociolinguistic factors that characterizes these studies has often been disfigured by elevating this approach to the status of dogma: there has been a tendency, in other words, for some scholars to view nearly any urban-Latin *explanandum* through dialect-colored lenses. The following example may serve to illustrate this tendency.

E. Peruzzi, in a chapter on "Dialetti litoranei a Roma" (*Aspetti* 79-160), has attempted to establish the existence of a "zona litoranea laziale" as a sociolinguistic construct, on the basis of a lengthy series of paired forms ("coppie") distinguished by alternation between *a*- and *o*-vocalism, of which the former is said to be "typical" of this "area costiera del Lazio".[1] The "coppie" adduced by Peruzzi (84ff.) consist of pairs like the following:

vacō : *vocō* 'be empty', *vocīvus* 'vacuus' etc.
faveō : **fove** (CIL 573) 'cherish'
cavus : *covus* (cf. Cat. *cova,* Span. *cueva* etc.) 'hollow'
rādō 'scrape' : *rōdō* 'gnaw'
caedō 'cut (down)' : *cūdō* 'beat' (i.e. **kaid-/*koid-*)[2]
laedō 'injure' : *lūdō* 'play'[3]
Osc. **tanginúd** 'sententiā' : Lat. *tongeō, tongitiō* [4]
arx 'citadel' : *ocrem* 'montem confragosum' (Fest. 192.1 L, P.F. 193.1 L)
auillus 'lamb' (P.F. 13.14 L) : *ouis* 'sheep'

---

[1] Peruzzi's entire conception, and many of his key examples, are discussed approvingly (in terms of diglossia) by R. Giacomelli, *Graeca Ital.* 141 n. 11.
[2] "Tanto *caedō* quanto *cūdō* hanno lo stesso significato: 'battere'" (109).
[3] "La voce *lūdus* avrà indicato il 'combattimento' e quindi il luogo ove questo si esercitava, ... il verbo corrispondente, *lūdō,* conserva chiara impronta del significato originario perché vale 'compiere un esercizio fisico, un gioco, uno sport' ecc." (113).
[4] Fest. 488.7 L, cf. P.F. 489.5 L: "Tongere nosse est, nam Praenestini tongitionem dicunt notionem".

among many others. It is evident, however, that the quality of Peruzzi's hypothesis depends on the precise nature of these "coppie", which are in fact very diverse, and susceptible of many other sorts of explanations. Some cases pose complex and long-standing phonological problems, as yet not entirely resolved (as in *vacō/vocō*[5]); in others, the alleged etymological connection is either doubtful, or so remote as to be without much value for Peruzzi's purposes (thus *caedō/cūdō, laedō/lūdō*); still other alternations can be accounted for on the basis of apophonic variation (cf. **3.5.c** below on *rādō/rōdō*), sometimes together with well-established phonological rules (thus Osc. **tang-** regularly from zero-grade **tn̥g-* [: Go. *þugkjan*] via "Untermann's Law", vs. Lat. *tongē-* < **tong-éje/o-*; cf. Meiser *Lautgesch.* 70 with n. 2); and so on. This is not to deny the sociolinguistic interest of Peruzzi's hypothesis; but such a theory cannot be confirmed without discriminating much more carefully among the competing explanations for the forms in question.

Naturally enough, this tendency to overvalue "dialectal" explanations has its contrary expression, in the virtually systematic rejection of allegedly "dialectal" factors for the explanation of various grammatical, orthographic (etc.) phenomena. In general, this is the approach favored by Wachter throughout his recent monograph (*Altlat. Inschr.*), evident from any number of his discussions: alleged Etruscan influences are persistently excluded as explanations for numerous early Praenestine forms, for which inner-Latin explanations are earnestly sought; and similar explanations are devised for numerous features found in inscriptions from Oscan- and Umbrian-speaking areas, where dialectal influences are mostly described as minimal. Many of Wachter's "native" explanations are no doubt correct, and his approach also serves, at least in part, as a beneficial counterweight to the opposite tendency described above. But both approaches, to my mind, share an extreme, doctrinal component that I have attempted to avoid, in favor of what I hope is a more dispassionate sifting of the facts. Giacomelli, for example, has argued strongly in favor of a "dialectal" explanation for Latin **af**, excluding accounts based on assimilation, while Wachter, as usual, rejects dialectal influence and favors the assimilatory

[5] On this problem see now Szemerenyi *Quellen* 81ff., and on Latin *a*-vocalism generally (with discussion of many of the forms adduced by Peruzzi) see Schrijver *Laryngeals* 420ff.

explanation. I hope to show in Chapter 6 that there is an element of truth in the positions of both scholars, once the synchronic and diachronic perspectives are properly kept apart: **af** may have entered Latin via some non-urban speech form, but **af** itself is best explained in terms of assimilation. Most such problems, unfortunately, do not lend themselves to such relatively simple synthetic solutions, but the goal is always to determine how best to characterize the extent of dialectal influences, if any, on Latin, and occasionally vice versa. I hope to show that in general, actual morphological influences per se are rather weaker than have been supposed, while certain largely neglected forms of orthographic and paleographic influence, often involving onomastic data, cut a surprisingly large figure in these documents, and can sometimes shed light on a variety of problems or features.

3. It hardly needs to be added that the linguistic import of some archaic inscriptional material extends beyond the "urban/non-urban" confines just discussed, to include a range of broader issues in the history of Latin, Italic, and even Indo-European. Unfortunately, the epigraphic data adduced in support of theories with serious linguistic consequences is all too often fragmentary or otherwise equivocal; the facts must be established with care, and their use controlled via delicate and painstaking argumentation. The results, in such cases, are often essentially negative. But when the archaic inscriptional evidence (as opposed to the available literary evidence) for a particular linguistic theory is crucial (as in L. Prat's theory concerning the historical background of the thematic ablative singular, discussed in Chapter 7), a negative finding may represent a useful form of progress.

4. According to a famous pronouncement of Ernout, issued in his classic study of Prenestine Latin ("Parler" 345), "la langue des inscriptions officielles Romaines est sujette à variations arbitraires et inexplicables: c'est un composé d'archaïsmes et de dialectismes employés au hasard." The general truth of these assertions seems difficult to deny, as anyone with even a passing acquaintance with these documents (or perhaps especially such a person) will agree. But in some respects this approach is excessively pessimistic, if not in fact dangerously exaggerated: we must remain open to

the possibility of finding at least some forms of method in the orthographic and paleographic madness — perhaps according to constraints or principles not yet dreamt of in our philosophy. One of the major concerns in these investigations has therefore been to tease out whatever may be systematic in some otherwise seemingly arbitrary practices, both in official documents, and more generally. With a similar interest in attempting to reduce the body of "variations arbitraires", I have also been concerned to elucidate, when possible, more of the actual *development* of certain conventions than has hitherto been seen within the history of Republican Latin epigraphic practice.

5. It must be said, in conclusion, that "the history of Republican Latin epigraphic practice" is an entity with a regrettably shadowy existence. In general, the pre-Augustan materials — and especially those belonging to the earlier period (i.e. before about 150 B.C.) covered in Wachter's monograph — receive very short shrift in the epigraphical handbooks. Numerous features of orthography, lettering, and other techniques are mentioned (if at all) in a vague and cursory way, most often as diagnostic criteria that may assist in the evaluation of absolute dating or relative chronology: if these features are not present in a text, the epigrapher can conclude that the document does not belong to the archaic period, and can then (the manuals seem to say) get on with the real work of Latin epigraphy. This somewhat dismissive attitude toward the archaic material is grounded, of course, in the intransigent facts that there is relatively little of it, and that the little we have (partly for its very paucity) is extraordinarily difficult to evaluate. These considerations do not, however, diminish the intrinsic interest or importance of the archaic data, which contain many features deserving detailed study. Wachter's recent book has begun to remedy this situation, so that eventually it may be possible to write something like a proper "history of Republican Latin epigraphy". Many of the studies herein can thus be viewed as preliminary contributions toward this particular desideratum of classical scholarship.

CHAPTER ONE

The Forum Inscription

1.1 *On Deviations in the Direction of Writing*
1.2 *Excursus: On the Direction of Writing in CIL 5*
1.3 *On the "Inverted" Lines*
1.4 ***recei (5), quoi (I), m:ite (12) and the Structure of the Text***
1.5 ***sor[-][, sordI*** *etc. (3)*
1.6 ***:kapia:d-*** *(11)*
1.7 ***loi{u}quiod*** *(16)*

1.1 *On Deviations in the Direction of Writing*

1.1.a There are two well-known types of deviation from the right-to-left boustrophedon pattern established in the opening lines of the Forum Inscription (CIL 1),[1] one of which concerns an unexpected change in the direction of the script, and the other, lines whose characters are unexpectedly inverted. Both are generally described as errors or lapses on the part of the stonecutter, and assumed to be idiosyncratic features of this particular inscription. But this is not the only possible interpretation of such features, which may have more interest than is generally thought. I consider first the unexpected change in direction, often compared with a similar direction change in the early boustrophedon inscription CIL 5 (itself discussed further in **1.2**); I then turn in **1.3** to the problem of the inverted lines, which, together with the direction-change problems, are related to questions concerning the structure of the text (**1.4**). The remaining sections (**1.5-7**) concern problems associated with the reading and interpretation of individual words.

---

[1] Pp. 367 (with photos), 717, 739, 831, 853; Wachter *Altlat. Inschr.* §§25-6, Gordon *Introduction* 4, Morandi *Epigrafia* 6 (photos Tav. 5), Degrassi *ILLRP* 3 (*Imagines* 378), Palmer *Lat. Lang.* 3, Ernout *Recueil* 2, Pisani *Testi* A1, Warmington *Remains* p. 242.

1.1.b The direction change in question concerns lines 11 and 12.[2] Whereas line 11 (the last line of the third face) runs right-to-left, line 12 runs right-to-left as well, thereby apparently abandoning the alternating boustrophedon pattern established at the outset, and otherwise maintained — with the important exception of the inverted lines 8 and 9, which will concern us later. The communis opinio that the unexpected maintenance of right-to-left direction in line 11 is an error has recently been reiterated by Wachter,[3] whose account of the engraving process will be presented in more detail below (**1.3.a**).

1.1.c G. Radke, in his recent study of the Forum Inscription (*Arch. Lat.* 68ff.), has offered two interesting new paleographical proposals, the first of which concerns precisely the change(s) in direction just described. Radke observes (p. 69) that the consecutive pairs of lines 16/1 and 11/12 are both written right-to-left, and thereby break the boustrophedon pattern; he therefore hypothesizes the existence of two major sections of the text, the first beginning at 1, and the second beginning at 12.[4]

Wachter (n. 167) finds the idea of a new section beginning at line 12 improbable, since the line begins with the single character M followed by word-divider, thus clearly held over from a word ending in -a]m, -o]m, etc., at the end of the preceding line. He goes on to admit, however, that the relatively large size of the M (esp. horizontally) might well have caused it to spill over from the preceding line. Moreover, evidence based on the behavior of word-division at line-end will be presented in Chapter **13** below (**13.2**), indicating that this particular break is aberrant for this

---

[2] The arguments in this chapter will be easier to follow if the reader can simultaneously consult a good set of photographs of the inscription, such as those provided by Gordon (*Introduction* Plate 3), or better (because of the larger size of the reproductions) those in CIL (ad pag. 368), Degrassi (*Imagines* 378), Palmer (*King and Comitium* Plates 2-5), or (for the first, second, and third faces only, the fourth being poorly photographed) Morandi (*Epigrafia* Tav. 5).

[3] *Altlat. Inschr.* §25d: "der Schreiber nach dem dritten Umwälzen zwar auf die richtige Seite hinüberwechselte, aber versehentlich nicht boustrophedon, sondern stichisch weiterfuhr".

[4] Cf. already Palmer, *King and Comitium* xi: "Lines 11 and 12 run in the same direction. The interruption could indicate a change in context." Palmer concludes, however, that "we have no fund of archaic inscriptions written in this manner to elucidate the significance, if any, of interrupted *versus* direction." This evaluation, while surely accurate within the immediate context of Archaic Latin inscriptions, may nevertheless be overly pessimistic, as will be suggested below.

inscription; if this is so, it would again suggest that this "spilled over" M has been placed at line-initial position as an expedient, which would further mitigate this particular objection to Radke's theory of a new section-opening at line 12. On balance, then, Wachter's objection based on the M is not conclusive.

1.1.d Apparently in support of his theory, Radke adduces as a parallel the evidence of the archaic (probably fourth-century) boustrophedon inscription CIL 5 (the famous "Caso Cantovios" bronze, from Lacus Fucinus), in which lines 3 and 4 seem to show a consecutive left-to-right direction, breaking the boustrophedon pattern in a way similar to the consecutive right-to-left lines 11 and 12 in the Forum Inscription.[5] But the parallel extends only to the line-direction pattern itself, and not to any alleged connection between such a pattern and the beginning of a new section, since there is clearly no break of any kind in lines 3-4 of CIL 5 — indeed, they include a prepositional phrase that crosses over from line 3 to line 4, including a word-division **e- | -salico** (or **e- | -ţalico** 'Italicorum', à la Peruzzi "Marsi"), across the two lines, which read as follows:

3 **p.apurfinem.e** —>
4 **salico.menur** —>

In fact, the explanation for the persistence of what appears to be left-to-right direction in these consecutive lines of CIL 5 is unrelated to considerations of text structure. According to the conventional view (see most recently Wachter *Altlat. Inschr.* §169b), the consecutive left-to-right lines simply attest to the probable dominance, at this period, of left-to-right writing, despite the boustrophedon patterning. This explanation seems to match other similar features, namely the fact that the inscription apparently begins in a left-to-right direction, and the fact that in three instances, right-facing letters wrongly appear in right-to-left lines (S in 2 and 5, B in 5), and finally, the fact that all A's are of the open type most commonly found

[5] This comparison with CIL 5 had already been signaled by Comparetti (*Iscrizione* 10).

in left-to-right styles.[6] Therefore, the directional behavior of CIL 5 provides no support whatsoever for Radke's interpretation of similar facts in the Forum Inscription.[7]

Essentially the same arguments concerning the dominance of (in this case) right-to-left writing have long been advanced for the Forum Inscription, including the repetition of right-to-left direction in the consecutive lines 11 and 12.[8] This parallel with CIL 5, *mutatis mutandis* (cf. **1.2** below), would again appear to weaken Radke's theory. But there is also a sense in which it tends to strengthen it: the establishment of a dominant right-to-left orientation for the Forum Inscription, which seems indisputable (note the right-to-left beginning), might also mean that a new section could well have been begun in a right-to-left direction, regardless of the direction of the preceding line (more on this point below). In conclusion, neither can Radke's hypothesis be supported on the basis of facts from CIL 5, nor can it be rejected on the basis of internal evidence, which is in fact consistent with Radke's claim (if one grants the special circumstance of a "spilled over" M, as noted above). There is, however, further evidence bearing on the problem, which will emerge below (in **1.3** and **1.4**) in connection with other problems.

---

[6] It is worth noting that the reversed B is the first character of line 5; that is, it directly follows the "wrongly"-oriented line 4, and simply continues the same direction there established. The character following the B is a directionally equivocal I, and thus it is only with the (left-facing) third sign D of line 5 that the expected right-to-left direction is unambiguously restored.

[7] There is some reason to believe that the direction of writing in CIL 5 may actually have been not left-to-right, but right-to-left; see the Excursus on this point directly following, in **1.2**. This would not, however, invalidate the statement just made about the lack of support for Radke's hypothesis from the directional behavior of CIL 5, regardless of its "dominant" mode (whether this is left-to-right or right-to-left).

[8] E.g. Comparetti *Iscrizione* 10, see now Wachter *Altlat. Inschr.* §25d.

1.2 *Excursus: On the Direction of Writing in CIL 5*

1.2.a With regard to CIL 5,[9] the possible loss of the bronze plate itself has naturally put severe limitations on its paleographical analysis;[10] one must therefore rely not only on the photographs and the familiar facsimiles published by Barnabei, Jordan and others (and frequently reprinted, as in CIL p. 372, or Peruzzi "Marsi" Figg. 1-2), but also on the various early descriptions based on autopsy, and the studies based on them (see CIL p. 372 for details). It is surprising, then, that the important observations by Goidànich concerning the fundamental question of the direction of writing (*SIFC* 10 [1902] 240f., quoted by Peruzzi "Marsi" 167 n. 3) seem now to be generally neglected (even by Peruzzi, a point to which I return in **1.2.c**). According to Goidànich, the letters were produced by relief work, i.e. by means of very closely-spaced raised perforations (or near-perforations) in the bronze. Moreover, the nature of the relief technique is such that the impressions were produced *on the reverse side of the plate,* having been engraved *right-to-left;* consequently, the directionality of the script and the nature of the characters themselves must properly be considered by viewing the inscription *a tergo* — for example, by holding a facsimile up to the light and viewing it through the back of the page. Thus the dominant direction of writing — as indicated by the right-to-left (under this interpretation) beginning of the inscription, the consecutive right-to-left lines 3-4, and the orientation of the reversed characters — is actually *right-to-left* (precisely as in the Forum Inscription), and not left-to-right, as is generally supposed.

1.2.b Although the traditional "face value" interpretation of CIL 5 is certainly possible, it seems equally probable that this only other Latin (or nearly-Latin) exemplar of archaic boustrophedon technique, beyond the Forum Inscription, shows the same fundamental right-to-left orientation. It seems not impossible, moreover, that this archaic technique was preserved

---

[9] Pp. 372, 717, 739, 859 (photo tab. 2 fig. 1); Wachter *Altlat. Inschr.* §169, Degrassi *ILLRP* 7 (*Imagines* 24), Ve 228a, Bottiglioni *Manuale* 135, Pisani *Testi* A6, Warmington *Remains* p. 58; see also Peruzzi "Marsi", Radke *Arch. Lat.* 219 n. 40.

[10] See the discussion by Peruzzi "Marsi" 166f.; Degrassi (CIL p. 859) writes "Lamellam interiisse non puto, sed etiam nunc in museo Torlonia aditu difficillimo", but Prosdocimi and Marinetti ("Terza plurale" 108) explicitly state that "la lamina è attualmente perduta".

somewhat longer in more remote areas, even as it was being supplanted by other techniques, as attested earlier than CIL 5, but within Latium: cf. the right-to-left stichic organization of the Castor-Pollux dedication (CIL 2833), the left-to-right stichic arrangement of the Lapis Satricanus (CIL 2832a) and the Corcolle altar fragments (CIL 2833a, Chapter 2 below), etc.

1.2.c As Goidànich himself saw clearly, his analysis is of some importance for the question of the date of CIL 5. Although the sixth- and fifth-century datings arrived at by earlier scholars are no doubt extreme,[11] the document may not be quite as late as is now generally assumed, i.e. "second half of fourth century" (e.g. Degrassi *ILLRP* 7 and *Imagines* 24), "late fourth century" (e.g. Pisani *Testi* A6, De Rosalia *Iscrizioni* 3, Radke *Arch. Lat.* 128), or even "about 300 B.C." (e.g. Warmington *Remains* p. 59, Leumann *LLuF* 7), or "saec. III" (CIL p. 859, after Devoto *Storia* 195). Peruzzi, who attempts to establish a late-fourth-/early-third-century dating (see "Marsi" 188ff.), naturally downplays the evidence of the direction of writing (see esp. 167ff.), although he cites the analysis by Goidànich in extenso. Nevertheless, Peruzzi's analyses of the evidence of individual letter forms (p. 168, concerning C, R, and Q) are either specious,[12] or inconclusive;[13] moreover, his comparison (p. 169) of CIL 5 with the letter forms of the Scipionic epitaphs CIL 6 and 7 is inappropriate, except under a strict construction of the actual wording of his comparison ("CIL 5 is more like CIL 6 and 7 than it is like the Duenos inscription"), which renders it devoid of much value.[14] More appropriate parallels may be found, for example, in the fourth-century inscriptions just cited in n. 13,

---

[11] For a convenient list, with references, see Peruzzi "Marsi" 168 n. 3; cf. CIL p. 372, judging the bronze to be not much later than the Duenos inscription.

[12] Thus the rounded form of the C has no diagnostic value: cf. already the rounded C of CIL 2916k(c-d) **Pacua** (5th c.; photo tab. 125 fig. 2 and *Lap. Sat.* Plate 17 fig. 4).

[13] The R with (NB: short!) tail merely serves to exclude a sixth- or (early?) fifth-century dating, cf. the fourth-century examples **Parca.Maurtia** (CIL 2844, photo in Degrassi *Imagines* 6), **sacro.matre.Mursina** (CIL 580, photo in Degrassi *Imagines* 102); on the possibly Faliscan (early?) fourth-century red-figured vase inscription CIL 454 (with R in **Menerva**), see Wachter *Altlat. Inschr.* §166.

[14] Similarly Colonna (in *Lap. Sat.* 50 n. 17), who suggests (without discussion) that Peruzzi's dating seems too late on epigraphic grounds.

as well as the other Tor Tignosa dedications CIL 2845 and 2846 (Degrassi *Imagines* 4 and 5).

1.3 *On the "Inverted" Lines*

1.3.a Gordon's description of lines 8-9 and 16 (*Introduction* p. 79) succinctly introduces both the problem, and its standard interpretation:

> lines 8-9 ... and line 16 ..., while boustrophedon, appear to be upside down if considered from the same point of view as the other thirteen lines, presumably because the cutter forgetfully changed his position vis-à-vis the cippus. Actually, line 8 must have been cut from right to left, like line 7, line 9 from l. to r., like line 10, and line 16 from l. to r., like line 15: it is more credible that the cutter changed his position than that he cut anything upside down.

The same scenario has been elaborated by Wachter (*Altlat. Inschr.* §25d), complete with drawings of the stone and an accompanying stick-figure stonecutter, portraying the cutter's presumed position with respect to the stone at various stages of the engraving. The essential conception is the same as that of Gordon (and others): after turning the stone over prior to engraving the third face, the cutter accidentally found himself in the "wrong" position, and carved two full lines (8 and 9) before he noticed his "error"; he then resumed cutting lines 10 and 11 by moving over to the other, "correct" side of the stone. Finally, after the stone was placed in position for the engraving of line 16, he committed the same "error" in positioning as before, thereby producing the final "lapsus".[15]

There are, to be sure, other lapses that are clear enough (cf., for example, **1.6.b** below on the I of **kapia**), and there may be some truth in Palmer's dictum that "writing did not represent an art at the time of the inscription" (*King and Comitium* xi). But we may wonder just why the

[15] Compare, in more general terms, the comments by Goidànich (*L'Iscrizione* 392) on the stonecutter's distraction due to the length of the inscription, whence his disorientation with regard to "left", "right", "up", and "down".

stonecutter — who was clearly not without *some* experience — might mistakenly have positioned himself for engraving in this way not once, but *twice*, and whether it is credible that he continued to engrave *two* full lines before correcting such a blunder. Moreover, the status of the "extra" concluding line (16, adjacent to line 1) is clearly special, despite its superficial resemblance (in terms of the inversion of the lettering) to the problem in lines 8 and 9, and might therefore allow for a somewhat different explanation. In short, there is room to explore alternative conceptions of these problems. Despite the natural pessimism arising from the paucity of similarly-composed Latin inscriptions (cf. n. 4 above), one must begin by examining what evidence does exist from Latin, and then (in view of the limited nature of the Latin material) consider evidence from other archaic boustrophedon traditions in Italy and elsewhere.

1.3.b Before turning to evidence external to the Forum Inscription, we may first address the problem of line 16, which may admit of a relatively simple solution, beginning from the facts that line 16 is not only (a) the continuation of line 15, but also (b) the last line of the text, which nevertheless (c) lies adjacent to line 1, the first line of the text.

A "correct" or "expected" continuation of line 15 (which reads left-to-right) would have caused line 16 to read right-to-left, with its lettering therefore exactly parallel to the adjacent right-to-left line 1. Moreover, there is a considerable degree of overlap in the actual letters composing (esp. the beginnings of) lines 16 and 1. As they are positioned on the stone, but substituting the "correct" (or "expected") orientation, the openings of these lines would have appeared to a reader as follows (except, of course, oriented vertically):

16		**D**	**O**	**I**	**V**	**Q**	**VI**[16]	**O**	**L**
1		**O**		**H**	**I**	**O**	**V**	**Q**[17]	

[16] On the reading of this character or characters see **1.7** below.
[17] The apparent indentation here is discussed further below (**1.4.c**, **1.4.f**).

Such similar adjacent sequences (note especially **LOIVQ-/QVOI**) might well be considered to pose an obstacle to legibility (especially if one considers the vertical orientation); furthermore, two consecutive lines with the same right-to-left direction — one of which is the first line of the inscription, and the other of which is the last — might also have been seen as something to be avoided, if at all possible, since it would have blurred the distinction (already difficult enough, in a production of this type) between the beginning and ending of the text.[18] One of the evident solutions to this problem corresponds to the actual appearance of line 16: maintain the correct direction of writing, but *visually disassociate line 16 from line 1 by inverting its lettering.* According to this conception, then, the inversion found in line 16 might in theory be something quite other than a blunder: it could instead reflect a deliberate decision to apply a variation considered permissible, at least under the special circumstances found here, so as to enhance the legibility of both line 16 and line 1, and to delineate more clearly the beginning and ending of the text.

1.3.c There is, moreover, independent evidence to suggest that inversion of a line (or lines) in some early boustrophedon contexts is not only a permissible deviation, but one that can be associated with certain functional considerations. This is precisely the practice Jeffery has described in terms of "false boustrophedon" (*Local Scripts* 49f.), investigated in more detail by Zinn ("Schlangenschrift"). As Jeffery points out (p. 50), this feature is by definition only consistent with *vertical* engraving; and further: "In vertical inscriptions of any length a line of false *boustrophedon* might be introduced at the start, to mark the beginning; for an inexperienced reader, faced with the four sides of a stone stele inscribed continuously in vertical *boustrophedon,* might well require to have the start marked as clearly as possible". The parallels with the Forum Inscription are evident. Indeed, the Cretan materials provide in this

[18] This consideration might still have been a factor — especially if one considers the graphically similar letter sequences at the beginning of the two lines — even though the extra edge specially carved to allow for the fifth "face" might be thought to signal the end of the text unambiguously, and even if (as will be suggested in **1.4** below) there was another graphic indication of the beginning of the text.

respect (as in others, to be noted below) a remarkable parallel, namely the sixth-century legal inscription from Prinias, engraved vertically on a large pillar (*IC* i.xxviii.7; Jeffery no. 12, p. 315). As Jeffery describes (*Local Scripts* 313), the "large, awkward lettering ... allowed only four lines to the surviving wide face" (see the photographs, Plate 59) — i.e., exactly as in the second, third and fourth faces of the Forum Inscription. Jeffery notes, furthermore, that the inscription "evidently ran continuously from one face to the next, and the end was marked off from the start by a guide-line drawn between two of the lines on the wide face"; moreover, the single line thus separated from the other three is in fact inverted with respect to the orientation of the other lines.[19]

It can also be noted, in a more general way, that the serpentine formats encountered in both Venetic and South Picene also allow for inverted lettering as a more or less regular feature, although the principles governing its appearance there are not entirely clear; see especially Marinetti *Iscrizioni* 57f. on "indifferenza per l'orientamento delle lettere, che vengono frequentemente capovolte".

1.3.d Within Latin itself, as already noted, there are precious few paleographically comparable texts: no inverted characters are to be found, notably, in CIL 5. But an interesting parallel of sorts occurs in the "broken serpentine" inscription CIL 2841,[20] with a text in the manner of a *sors* inscribed on a small round stone. Naturally, the compressed format and the shape of the object might allow for special treatment, but one which presumably would fall within certain norms of technique, and which would be consistent with concerns for legibility. Here the second line (**perdere**) is inverted with respect to the first line, with the last letter (S) of the first line (**se.cedues.**) curving sideways into the second line, as a sort of serpentine transition. The original orientation is then restored in the third line (**nolo.ni.** etc.).

---

[19] It is also worth noting that "false boustrophedon" inversion is attested not only contemporaneously with the Forum Inscription, but also somewhat closer to Rome, i.e. in some Greek inscriptions from Sicily; see e.g. Dubois *Inscriptions* 73 (with facsimile), a four-line inscription on a large stele, with the last line inverted (Dubois: "*boustrophédon* l. 1-2, mais serpentine l. 3-4").

[20] P. 863, with facsimile (unknown origin, 3rd/2nd c.); Degrassi *ILLRP* 1070 (*Imagines* 354), Wachter *Altlat. Inschr.* §215b.

1.3.e It is important to note, finally, that the inverted orientation of line 8 has as a consequence the right-to-left direction of the writing, beginning at that point, directly after the right-to-left line 7. In this sense, then, the right-to-left consecutive lines 7 and 8 are parallel to the right-to-left consecutive lines 11 and 12. Since inversion, as just discussed, may reflect an acceptable option, the significant (or at least an equally significant) feature (with regard to the inverted lines 8-9) may well be the new right-to-left direction established in line 8 (despite line 7), and therefore the parallelism with lines 11-12 may assume some importance, as will become clearer below.

1.4 *recei (5), quoi (1), m:ite (12) and the Structure of the Text*

1.4.a The second new analysis proposed by Radke in his recent study of the Forum Inscription (for the first, cf. **1.1.b** above) concerns a new reading for the opening of line 5. Radke writes (p. 75):

> Es ist mir unbegreiflich, dass alle guten Photographien und Nachzeichnungen des Inschriftentextes in Zeile 5 die deutlich erkennbaren Reste eines Buchstabens — und zwar eines *o*, das nicht kleiner ist als das zweite *o* in Zeile 1 und das erste *o* in Zeile 15, um von denen in Zeile 16 ganz zu schweigen — zeigen, dieser Buchstabe aber in keiner Umschrift oder bei keinem Deutungsversuch auch nur erwähnt wird (siehe Skizze S. 76).

As Radke goes on to observe, the resulting **orecei** at the beginning of line 5 would have a number of far-reaching consequences. Nevertheless, Blümel ("rez. Radke" 46f.) has correctly called this hypothesis into question, noting that according to the photographs, this alleged O, pace Radke, is not only smaller than it would appear to be from Radke's "Skizze", but surely smaller than all of the other O's in the inscription. Neither Radke nor Blümel, however, seems to have noticed the extended discussion of this feature by Goidànich (*L'Iscrizione* 389):

> Nella seconda faccia, r. 2 a destra di RECEI c'è, come ricordavo, un segno che a giudicare dalla fotografia pare un piccolo *O* ..., lettera assolutamente aliena dal contesto ... . Ma, esaminato il segno da vicino sull'originale e sui calchi: esso appare non più un *o*, ma un guasto che à l'aspetto, per così dire, di una chiocciola con tutto il mollusco fuoriuscito e in movimento; e, tenuto conto anche del fondo della lacuna, risulta indubitabile che esso si deve a grumi di pomice caduta e che non è affatto un segno di lettera.

There seems little doubt, then, that the depression in question is not an O, although there is more to be said about its possible interpretation.

1.4.b These comments by Goidànich are found in the context of a larger discussion of various depressions he assumes to be unrelated to letter traces, as opposed to effects arising from the nature of the stone, and its treatment and deterioration subsequent to the engraving. Indeed, this is quite clear for virtualy all of these "buchi più notevoli per la loro profondità" (listed by Goidànich on 388f.), in view of their positions on the stone (e.g.: too distant from existing letters, or found at the extreme ends of individual letters themselves), in addition to (or sometimes in combination with) their shapes (e.g. elliptical or oblong depressions apparently randomly spaced in the vicinity of various letters, etc.). The mark before **recei**, however, differs markedly from almost all (indeed: as we shall see, all but two) of these "buchi", in showing the following combination of features:

(i) it appears in line-initial position, slightly to the right of the position occupied by the initial letters of the other three lines on the face;

(ii) it seems to occupy nearly a single letter space, especially in view of the fairly clear *indentation* of the following **r** of **recei**, vis-à-vis the other line-initial letters on the face;

(iii) despite the irregularity on the left, causing the somewhat snail-like appearance described by Goidànich, this mark is essentially circular,

although it is clearly not an O, being smaller than the smallest O's (see esp. the O of **quoi**, line 1);

(iv) in terms of its vertical positioning, it occupies the bottom half of its letter space (cf. (ii) above), although it does not quite reach the bottom line of the other characters in its line.

1.4.c The striking correspondence between the features just listed for the mark preceding **recei** and the identical features shown by another depression seems not to have been noted by Goidànich, or anyone else, as far as I have been able to determine. I refer to the depression preceding **quoi** in line 1, at the absolute beginning of the inscription, merely listed by Goidànich as the first item in his "elenco dei buchi più notevoli per la loro profondità" (p. 388: "1ª riga, a destra di *QYOI*"). Although the diameter of this depression appears to be slightly smaller than that of the one before **recei**, and its shape is somewhat more regular, it is otherwise nearly identical with respect to its defining characteristics: it occupies a single letter space in line-initial position, the following character is indented (in this case rather more clearly: the depression lies directly above the first letter (S) of the following line, while the Q — the first letter of the first word of the inscription — lies directly above the *second* letter (Ǝ) of the second line), and its vertical orientation is identical, again occupying the lower half of the space, although not quite reaching the bottom line. It is especially instructive here to compare the two O's that follow in line 1 (in **quoi** and **ho**), which, in addition to being markedly larger, occupy the upper areas of their letter spaces. The inscription begins, then, with a sequence that can be transcribed, for convenience, as ∘**quoi**.

1.4.d Clearly, there can be no question of a reading **oquoi**, any more than (or still less than) Radke's reading **orecei** for line 5, as discussed above; but especially in view of the indentation of the Q, it seems possible that this depression is an intentional mark, whose function or meaning remains to be elucidated. Because of its appearance at the beginning of the inscription, and given the boustrophedon technique, the irregular word-division, and the overall design of the inscription (i.e. its continuous and possibly complete coverage of all four faces, cf. the extra fifth edge used to carve the final line 16), I suggest that this punct-like

mark (together with the indented following character it entails) might simply have been used to signal the absolute beginning of the inscription.[21]

The absence of similar Latin inscriptions from this (or any other) era, as well as the simple nature of such a device, prevent us from determining whether this usage — if this suggestion is correct — was merely an idiosyncratic *trouvaille* on the part of the stonecutter dreamt up for this inscription, or a trait used by him with some regularity, or (in the latter case) whether it was part of an inherited scribal tradition of some sort. In this connection, however, several parallels are worth noting.

1.4.e H. Hoenigswald has noted the use of a punctuation sign "per indicare l'inizio-fine di epigrafi circolari", including those written in scriptio continua, in Etruscan inscriptions (see "Punteggiatura" 215), and it is not surprising to find examples in Faliscan and Venetic.

In Faliscan, the archaic (sixth-century) *oinochoe* inscription Ve 242B (Giac. 2b) is written around the jug in a single line of scriptio continua, with the end (**uoltene**) separated from the beginning (**eco()quton̩** etc.) by means of a triple-interpunct ⁝, as noted by Vetter (although neither noted nor transcribed by Giacomelli, but clearly visible in photographs).[22]

In Venetic, the archaic (sixth- or early fifth-century) stone inscription *MLV* 75ter (= *LV* *Es 122, see now also *Veneti* 249ff.) is written right-to-left in scriptio continua, and without syllabic punctuation, around the circumference of the stone. The 60-letter text closes back on itself, with the first and last letters separated by a single punct. Similarly, the ovoid stone epitaph *MLV* 138 (= *LV* Pa 8, 1.351) reads right-to-left around the stone, and closes back on itself. This later inscription, however, is punctuated syllabically, with the usual points at the bases of letters (here **.n.** and **.s.**), as well as the small vertical strokes surrounding the mid-points of letters (here only for **.i.**, bis), as found elsewhere (cf. the similar inscription *MLV* 139 = *LV* Pa 9, 1.353). Thus the mark separating the first

---

[21] On this practice in general cf. **1.3.b-c** above. The relative depth of the depression need not constitute a strong argument against such an interpretation, since such markings need not have followed, in this respect, the same criteria normally applied to alphabetic letters.

[22] E.g. Giacomelli *Lingua fal.* Tav. III, Morandi *Epigrafia* Tav. VIII.4 (cf. also the facsimile, p. 57). In fact, the engraver ran short of space by a single character, so that the second e of **uoltene** actually appears directly below the interpunct.

and last letters cannot be expected to appear as either a lowered punct or a mid-point stroke: it is in fact a small *raised* vertical stroke.

In texts that make use of word-dividing interpuncts (or, as in Venetic, syllabic punctuation), this text-organizing notation provides a second "level" of punctuation, as it were, and therefore constitutes a form of "complex punctuation", a topic to be discussed in more detail in Chapter **16**. Here it can be noted, however, that this form of textual punctuation need not be restricted to the absolute beginning/ending of a text, but may also be used to signal one or more smaller divisions within a text. This is particularly clear, for example, on side A of the fifth-century Magliano plaque,[23] with an Etruscan text composed in a spiral serpentine format: here triple-punct phrase-dividers mark off units ranging in length from two words to about sixteen, with the words themselves separated via single-punct word-dividers with almost complete regularity

1.4.f Even if the depression before **quoi** is nothing more than a "grumo di pomice caduta", it may still be worth considering whether the indentation of the Q is itself meant to signal the beginning of the inscription. It is otherwise quite striking that despite the various often-discussed forms of irregularity and variation in lettering (including shape, size, distance from one another, deviation from the horizontal, etc.), the *vertical* orientation of the line-initial letters is relatively precise: that is, the first letter of nearly every line begins at approximately the same distance from the bottom edge, as is particularly clear on faces 3 and 4, as well as on the small extra edge carved out for the last word(s), the initial L of which lies even with (a) the last letter (D) on the fourth face, and (b) the initial depression before **quoi** (but not the Q!) on the first face. The conspicuous exceptions to this pattern, then, appear on the first and second faces, and in both cases, letters that appear to be indented are preceded by small circular depressions, each with the "letter-like" features (in terms of spatial orientation) described above. It thus seems possible that if the mark preceding **quoi** (and/or the indentation) is intentional, and if it is used to signal the beginning of the text, the similar mark preceding **recei** (and/or

[23] CIE 5237 = TLE 359, Morandi *Epigrafia* 2 (with facsimile; photographs Tav. III.1-2), Rix *Etr. Texte* XIII:AV 4.1.

the indentation) may likewise signal the beginning of a new text, or a new (more or less major) section of the opening text.[24] This hypothesis, in turn, entails that the preceding]a(:?)ḫas (as now generally read) ends a sentence — perhaps not an easy assumption, but the reading itself remains open to question: thus earlier]**asias** (Gamurrini, Hülsen et al.) may still be preferable, cf. Radke *Arch. Lat.* 70, 73, 75.[25]

1.4.g Finally, there is a third possible instance of a similar circular depression, although not a line-initial one. In line 12, the extra space between the first letter (M) and the following I, and the depression therein, have been noted explicitly since Comparetti (*Iscrizione* 9): "Dopo M spazio; in questo una rottura e punti deboli, incerti". The generally circular nature of the depression (see especially Palmer's photograph, Plate 4) has again led to its interpretation as an O (Stroux), this too having been pointedly rejected by Goidànich (*L'Iscrizione* 389f.). It should be noted, however, that Goidànich merely remarks (rather sarcastically) on the convenience of this reading for Stroux's overall interpretation of the text, and asserts that the extra space must have been due to a desire on the part of the stonecutter to avoid a particularly friable area of the stone. But the correspondences between this circular depression and those discussed above in terms of possible section-beginning marks (1 ∘**quoi**, 5 ∘**recei**) are striking: apart from the shape and size of the mark, the spacing is such that it occupies nearly an entire letter space (it lies above the H of the line below), and is located in the middle-to-lower area of the space, vis-à-vis the following letter.[26] It might be objected that such a mark is incompatible with the interpuncts that precede it, directly after the M. But, to the extent that these "punti deboli" can be interpreted as interpuncts at all, they lie

[24] Cf. Dumézil's conception that in this section of the text, "le roi, qui est le personnage essentiel, est mis en tête de tout l'énoncé" (*Latomus* 29 [1970] 1043 n. 2), although his conception of a syntactic attraction (*rex, ius ut ei est, cum iubet... > regi ius ut est, cum iubet...*), while possible, may be a needless complication. More simply, compare initial personal datives in legal phraseology of the type *Adsiduo vindex adsiduus esto* (XII Tab. 1.4), cf. Palmer's **recei iǫ[us esed]**.

[25] Despite Goidànich (*L'Iscrizione* 406ff.), there appears to be insufficient space between the first A and the Ḥ to allow for the F he attempts to justify (thus **ſḫas**, in a phrase **ſḫas | recei** 'fas regi', cf. the misleading transcription **FḪAS**, without comment, in Almar *IL* 1 [p. 11]).

[26] Rex Wallace (per litt.) calls my attention to the fact that the circular incision here has something of the same "snail-like" appearance discussed above for line 5.

nearly parallel to the last diagonal of the M, most similar to the diagonal interpuncts parallel to the left diagonal of the second A of **kapia**, in the preceding line. There, the spacing is so tight as to give the appearance that the word-division was added secondarily, as an afterthought or enhancement (cf. the added I of **kapia** itself, discussed in **1.6.b** below).[27] In principle, then, the word-division after M in line 12 could be of the same secondary type (perhaps partly motivated by the unusual line-division with spill-over (vowel plus) | **m**, cf. **1.1.c** above), and therefore does not constitute a strong argument against the interpretation of the following depression suggested (as a possibility) here.

1.4.h If the interpretation just suggested is accepted (together with the general conception of such markings hypothesized above), it would be of direct relevance to Radke's theory (**1.1.c**) that line 12 (although necessarily at **•ite**, not at **m:**) begins a new section, hitherto advocated only on the basis of equivocal facts concerning the directionality of the script, as already discussed.

It cannot be determined whether the line-initial position (or, in the case of 12 **•ite**, nearly so) and the right-to-left orientation of all three possible section-openings are significant shared features, or coincidental. It is suggestive, however, that the inverted orientation of the right-to-left line 8 allows for the possibility of another section-opening at the (missing) top of this line, which would yield a nearly symmetrical arrangement, with four sections of approximately equal length, three of which begin at the first line of a face:

---

[27] Similar added punctuation in (native) Umbrian practice (generally clear, once again, on the basis of spacing) is amply documented: see Prosdocimi *Tavole* Tavv. 11 (Ia 18-19 and Ia 19), 12, 13, 14 (Ia 22-3), 26 (IIa 9-10), 28 (IIa 35).

1	**∘quoi...**	<—	
2	xxxxxxxxx		
3	xxxxxxxxx		
4	xxxxxxxxx		
5	**∘recei...**	<—	
6	xxxxxxxxx		
7	xxxxxxxxx	<—	
8	**[∘(?) ...]m:kalato**	<—	("inverted")
9	xxxxxxxxx		("inverted")
10	xxxxxxxxx		
11	xxxxxxxxx	<—	
12	**(m:)∘ite...**	<—	
13	xxxxxxxxx		
14	xxxxxxxxx		
15	xxxxxxxxx	—>	
16	xxxxxxxxx	—>	("inverted")

This disposition, in turn, suggests another explanation (or at least a contributing factor) for the inverted orientation of line 8, already hinted at in **1.3.e** above. There it was noted that a consequence of this inversion was the maintenance of right-to-left direction. If a new section coincided with the beginning of this face, the overriding principle — given a system in which inverted lettering is otherwise an acceptable option, especially to distinguish section breaks — may well have been the maintenance of right-to-left direction, or the two features may be viewed as essentially interrelated, both consequent on the new section-opening. In much the same way, the "abandonment" of the boustrophedon pattern in 11-12 could be explained, much as Radke already suspected, as a consequence of the new

section-beginning at 12, which entailed, once again, the maintenance of right-to-left direction.

Viewed in this way, it is rather the reversion to the original orientation in line 10 that might require some explanation. But as the inscription approaches the fourth (and final) face, there would be a natural desire to return to the original orientation, which could easily be managed by resorting to the "false boustrophedon" license (as described above) in the middle of the third face.

1.4.i It is important to note, finally, that Radke's conception of the breaks in direction of writing as reflections of section-breaks, which I have tried tentatively to integrate with the possible section-opening marks discussed above, has strong support from normal paragraphing practice found in the two most comparable sets of early boustrophedon documents, namely those in Greek and Etruscan.

The paragraphing techniques characteristic of archaic Cretan wall-inscriptions — esp. early legal texts, including the famous Dreros fragments — have been described in detail by Jeffery (*Local Scripts* 44, 311). A boustrophedon text begun in right-to-left direction (the normal archaic mode) regularly begins a new paragraph in a right-to-left direction, *regardless of the direction of the last line of the preceding paragraph*, thereby producing, on occasion, two consecutive right-to-left lines.[28]

Essentially the same technique is attested in Etruscan, where one may note in particular the famous fifth/fourth-century Capua tile inscription (TLE 2, Rix *Etr. Texte* II),[29] preserving parts of sixty-two lines of a ritual (perhaps calendrical) text composed in boustrophedon style, of which the beginning portion is unfortunately missing. What is particularly significant, for our purposes, are the horizontal lines that seem clearly to mark paragraph divisions: note the extra space at the ends of most of the paragraphs. It is a striking fact that each paragraph (not counting, of course, the first, the initial lines of which are missing, as just noted) begins in a right-to-left direction, even if this breaks the "expected"

[28] Paragraph-end is sometimes also signaled by empty space, and punctuation is occasionally used to help signal the beginning of a paragraph.

[29] See also Morandi *Epigrafia* 4 (with facsimile; photo Tav. 4), with earlier references.

boustrophedon sequence established by the last line of the preceding paragraph. Thus the third paragraph ends with the brief sequence *ta aius nunθeri* (line 20), written right-to-left. The next line, i.e. the first line of the fourth paragraph (beginning *acalve* ...), *also* reads right-to-left.

As suggested at the outset, then, at least some of the features of the Forum Inscription involving letter orientation and direction change (generally regarded as "blunders") can instead be viewed within a traditional framework that allows for such techniques as licenses, and perhaps partly also as demarcating devices of potential interest in analyzing the structure of the text.

1.5 *sor[-][, sorḍ[etc. (3)*

1.5.a There has been considerable disagreement in the reading assigned to the fragmentary character following the **sor** of line 3, as shown by the following survey:[30]

> **sor.**. CIL p. 368, cf. **sor** Wachter, **sor[-][** Gordon;
> **sora[** Studniczka, Milani, **soraḍ[** Pisani, cf. Thurneysen **Sora[no]**, Stroux **Sor[anoi]**, Warmington **Soraḍ[***no*...**]**;
> **sorm[** Gamurrini (ed. princ.), Hülsen, Radke *Arch. Lat.* 73;
> **sorḷ[** Diehl, Ernout (but cf. p. 5: "**sorḷ** ou bien **sord[es]**"), L. R. Palmer;
> **sorde[** von Grienberger, **sord[** Goidànich, R. Palmer, Degrassi *ILLRP*, CIL p. 853, Peruzzi *Aspetti* 118

Although some continue to remain agnostic (Gordon, Wachter), the currently prevailing interpretation seems to be **sord[**, i.e. a form of *sordēs*, which is thought to provide a likely continuation of the preceding

---

[30] These indications are not exhaustive, but intended rather to provide a convenient and representative sampling of the major views that have been held; for bibliographical references to the older literature, see CIL and Radke *Arch. Lat.* 77ff., and for more thorough surveys and discussion of the older readings see especially Leifer-Goldmann *Forminschrift* 82 n. 4 and Goidànich *L'Iscrizione* 396ff.

legal/sacral context, in view of parallels like the well-known "Lex Lucerina" CIL 401 (**in.hoce.loucarid.stircus | ne[qu]is.fundatid** etc.). But **sord[es]** (or **sord[ibus]**, **sord[ebos]** etc.) is not without problems. In view of the presumed initial **sy̯-* usually reconstructed for this word (cf. **sy̯ordo-* in Go. *swarts* etc., as well as Iranian material adduced by Bailey, *Studies Palmer* 30), taken together with the **suodales** of the (somewhat later) Lapis Satricanus (CIL 2832a), we might well expect **suord[**, and not **sord[**, as has been noted more than once.[31] But even if this difficulty is somehow removed or mitigated (I return to this point below), there still remain paleographical objections to **sord[**. Despite the recent pronouncement in CIL I^2 fasc. 4 (p. 853: "post **sor** littera D certa est"), not to mention the considerable weight exerted by the wish to see a form of *sordēs* here, the D seems anything but certain. The earlier CIL discussion (p. 368) was quite clear on this point, asserting on the basis of autopsies by Hülsen and Dessau that nothing after the P (= **r**) was certain except for a vertical stroke, and the beginning of a diagonal descending rather sharply from its top (rendered, with orientation reversed, as N in CIL). Indeed, just these features are clearly visible in the photographs (see especially Gordon's *in situ* photograph 4a, Plate 3, or Morandi's Tav. 5.1), which show that the descending straight diagonal is quite unlike the pronounced curvature found in all of the other D's, of which there are no less than seven clear instances (lines 3, 10, 11, 14, 15 bis, 16). The traces, then, would seem to be most consistent either with A, or (more likely, perhaps) with M, whence Hülsen's **sorm[** (properly **sorɱ[**), still favored by Radke.

1.5.b As proposed by Thurneysen and others,[32] the reading **sora[** seems to require reference to the divine designation *Ditis pater Soranus* (cf. Radke *Gōtter* 290, without reference to this conjecture), an interpretation rightly rejected by Degrassi (*ILLRP* 3 ad loc.: "haudquaquam probabile"). At first sight, a **sorɱ[** would seem still less appealing, since the only conceivable comparandum might be *sermō* (thus **sorɱ[o]**, or perhaps more likely **sorɱ[on-]**), which raises obvious difficulties with the root

[31] See Blümel "rez. Radke" 58, with further references in his n. 38.
[32] For discussion and references, see Norden *Priesterb.* 258f.

vocalism.[33] There may, however, be ways of justifying the existence of an archaic **sormōn-*, which must begin by considering the presumed etymological basis of Lat. *sermō*.

1.5.c Lat. *sermō* is traditionally compared with *serere* 'join, align', *seriēs* 'row, series' (and further OIr. *sernaid* 'serit', Gk. εἴρω 'join', and other forms: *IEW* 911), hence *sermō* 'discourse, conversation, speech' < *'l'enfilade des mots' (Ernout-Meillet *Dict.* s.v.). This derivation, to be sure, is semantically plausible, "bien qu'aucune langue n'offre pour la racine **ser-* le même développement de sens" (Ernout-Meillet); and it appears not only to coincide with traditional Roman intuitions about the meaning of *sermō* (cf. Varro *L.L.* 6.64 *sermo est a serie,* Servius ad Virg. *A.* 4.277 *sermo est consertio orationis*), but also to account for well-attested lexical associations of the type *sermonem/-es serere* (Plt. *Curc.* 193, *Mil.* 700, etc.).

A Lat. **sormōn-*, then, could reflect either an *o*-grade **sor-mōn-*, which is morphologically aberrant, or a zero-grade **sr̥-mōn-*, for which there are certain suggestive possibilities. In principle, such a formation, if it is old, could reflect either an amphikinetic or proterokinetic paradigm, for which zero grade of the root is certainly expected in the weak cases. It can be argued on the basis of *pulmō* 'lung' that Latin could have generalized the zero-grade allomorph in such paradigms, although the root vocalism of this form is unfortunately problematic. Nevertheless, it remains possible that *pulmō* shows a metathesized version of zero grade **plumō* (cf. Leumann *LLuF* 101, 371, Frisk *GEW* s.v. πλεύμων) vis-à-vis the full grade in Gk. πλεύμων 'id.' and Ved. *klomán-* 'right lung'.[34] Thus **sorm̥[** could likewise reflect a **sr̥-mōn-* directly, and it would remain to account for the vocalism of (Class.) Lat. *sermō*. In the absence of known phonological processes (**so-* > **se-* vel sim.) to which one could appeal, this would have to be managed in some secondary way. In view of the above etymological discussion, however, Arch. Lat. *sormō* (if it existed)

---

[33] Hence Leifer-Goldmann loc. cit. (despite the discussion of evidence favoring **sorm̥**): "Es gibt kein mit *sorm* beginnendes lateinisches Wort, ebensowenig ein solches in den italischen Dialekten".

[34] Similarly Mayrhofer *EWAia* I.6 419 (s.v. *klomán-*), opting for proterokinetic **pléu-mō(n) : *plu-mén-s.*

might have undergone an association with *serere*, which represents the most frequent attested pairing of *sermō* with similar verbs (more rarely *sermonem copulare, sermonem conferre*).[35] The development of **sormo(nem serere)* to *sermo(nem serere)* might also have been supported by *termō*, which, aside from *pulmō*, is the only other member of this extremely limited morphological class that might occur with any frequency.

1.5.d There is also, however, an alternative etymology for *sermō*, comparing the **sụer-* of Go. *swaran* 'ὀμόσαι', Eng. *swear, answer* etc. (recently e.g. Leumann *LLuF* 189, Gamkrelidze and Ivanov *Indoevrop. jaz.* 123). In fact, this has certain attractions, including a direct connection to a verb of speaking, and the fact that a cognate may be attested elsewhere in Italic, i.e. Osc. **sverruneí** in the Cippus Abellanus (Ve 1.2, see Vetter p. 10 for the comparison with Go. *swaran*), although it must be admitted that the precise meaning of the Oscan term is open to some question.

One might object that the technical sense of **sụer-* arrived at by Benveniste (*Vocab.* 2.165: 'se porter garant') weakens the connection with *sermō* for semantic reasons, whence presumably Benveniste's preference for the traditional connection of *sermō* with *serere*. But Benveniste himself emphasized the easy development of meanings like 'answer for' and 'answer' from this root (cf. OIc. *svara* 'answer'); one might just as naturally, then, derive *sermō* from an original sense **'reply, rejoinder' (cf. also the technical sense 'disputatio' of *sermō*), whence 'conversational give-and-take, discourse', and thence the various other derived meanings of *sermō* ('speech/language', 'style', 'rumor', etc.). It is worth noting, in fact, that the continuations of both Varro's and Servius' discussions (cf. **1.5.c** above) emphasize for *sermō* precisely the necessity of at least two interlocutors (as opposed to a monologic speech situation) as the basis for the alleged connection with *serere: sermo est a serie; sermo enim non potest in uno homine esse solo, sed ubi oratio cum altero coniuncta* (Varro), *sermo est consertio orationis et confabulatio duorum vel plurium* (Servius).

---

[35] Note Plautus' still more extensive triple exploitation of the sequence *(ser- ser- ser-)* in *Curc.* 193 (cited above): *quod quidem mihi polluctus virgis servos sermonem serat?*

If, then, one begins from **sy̯er-*, the first task is to account for the initial *s-* of Lat. *sermō*. For this problem, Leumann (189) has observed that instead of assuming an inherited "Anlautwechsel" **sy̯-/*s-* (as is done, for example, by Gamkrelidze and Ivanov, op. cit. 124 — not surprisingly, in view of their interest in demonstrating the existence of a PIE labialized sibilant), the existence of Osc. **sverruneí** might suggest another explanation, although Leumann took the problem no further. One must begin, however, with the expected treatment of a sequence **sy̯ermōn-* (here necessarily assuming *e*-grade, as in *termō*): in view of *socer, soror* etc. (Leumann *LLuf* 47, Sommer-Pfister *Hdbch.* 55), this can be expected to yield (at least eventually, cf. below) a **sormōn-* regularly, which could still be attested in the **sorm[** under discussion. Once again, the presumed development (Arch.) *sorm-* > (Class.) *serm-* could be explained secondarily as above (except that here the association with *serere* would be folk-etymological).

What remains, finally, is the same problem raised by **suodales** for the traditional interpretation **sord[** (cf. **1.5.a** above): barring ad hoc phonological claims (such as that original **sy̯e-* > **so-* earlier than **sy̯o-* > **so-*, cf. next footnote; **sy̯orm-* > **sorm-* by labial dissimilation, while **sy̯od-* remains; etc.), one might still expect **suorm[** and not **sorm[** for this period. With **suodales** as the only datum, one is reduced to speculations of the sort entertained, for example, by Peruzzi (*PP* 33 [1978] 347), according to whom the retained **suo-** could reflect a dialectal treatment, with this particular archaism preserved longer at Satricum than at Rome.[36] Finally, one could also suppose that **suodales** is already an archaizing spelling at this time, for which the (only slightly?) earlier **sorm[** of the Forum Inscription (if that is the correct reading) shows the current outcome. In this case, however, the knowledge of this spelling would have been retained for a relatively long period of time, if Peruzzi (loc. cit.) is correct in thinking that "the etymologies of *sodalis* reported by Festus [382.15ff. L] imply the knowledge of this earlier form with *sw-*".

---

[36] On the Lapis Satricanus as "Volscian" (with the contemporary Lat. form expected as ***suedales**), see esp. Coleman "Central Ital." 120ff. (where, however, his mis-citation of **Mamartei** as **Mamertei** [121] leads to a spurious discussion of *Mamer-*). Contra Peruzzi, see Prosdocimi "Studi 1979" 217, distinguishing "*wo* (primario) > *o*" (as in **sord[**) from ****sy̯e-*** **> suo(dales).**

1.6 *:kapia:d- (11)*

1.6.a Here there is virtually no disagreement about the reading, and almost universal agreement about the interpretation: **kapia** (with following **d-**) reflects a 3sg. subjunctive *kapiād*, either directly (via a convention involving single spelling of identical word-final and directly following word-initial consonants, cf. 12 **ite:ri** perhaps for **ite(r):ri**, and the single spelling of geminates likely to be typical of this period in any case), or indirectly (via a misplaced word-divider).[37]

Neither of the two best-known alternative accounts of **kapia** is attractive. Pisani (*Testi* A1) reads **kapţa**, interpreting the phrase as **kapţa:dotav[e** 'capta datave', with **dota** based on a full-grade *to*-participle *$*deh_3$-to-* comparable to Ved. *-dāta-*. Although this theory directly accommodates the word-division, there is no paleographical basis for a reading **kapţa** (as will become clearer shortly), and no good evidence for a full-grade *$*deh_3$-to-* in Latin.[38] Palmer's neut. pl. **kapia** 'heads', based on an alleged by-form **kape -is* beside *caput* (*King and Comitium* 10), has no linguistic support: the OLat. compound forms in nom. *-cipes* he adduces do

---

[37] See most recently Wachter *Altlat. Inschr.* §26. In connection with this second possibility, it may be worth recording two hypotheses concerning the immediately following problematic sequence generally read **dotav[** (thus e.g. CIL p. 368, Stroux [**dotav[ierp**] = *[prei]vatod* backwards (!)], Warmington, Degrassi *ILLRP*, Ernout, Gordon ["capitalized" transcription], Wachter), but also, in view of what appears to be a small Y within and extending below the O, in diverse other ways (cf. already Goldmann's **dɪtav[**, taking the right (nearly vertical) stroke of this Y as an I, correcting the O): note especially Palmer's **duo tau[r-]** (cf. CIL p. 853 "**duo** (litteris V et O eodem loco scriptis) ex im. phot. Palmer", and Gordon's italicized version "*duo* (?) *tau* (or *tav*)..."), and alternatively the conception of both Goidànich and Dumézil, according to whom the Y corrects a faulty O (cf. Goldmann above), yielding **(kapia)d ut(i) a v[iad]** (Goidànich) and **(kapia)d ut au[gures]** (Dumézil). As a variant of this last version, it may be possible to take the sequence **utav** as reflecting not an elided **ut(i) au-** or **ut(i) a v-**, but rather **uta v-**, with an instance of the particle Hamp reconstructs as **uta* (cf. Ved. *utá*, Celtib. *uta*) for the Lat. "consecutive" *ut* of *ut ... nōn* etc. (*Glotta* 60 [1982] 115ff., see now also J. Klein, *HSCP* 94 [1992] 48f.). Note also that under the assumption of a false word division, one might also read **kapia{:}d(:)votav[**, with **votav[** reflecting an expected earlier form of *vetāre* (perf. stem **votāv-*, cf. *domāre* ? thus tentatively J. Jasanoff, *IF* 88 [1983] 70 n. 3), the perfect participle of which is attested in Nonius (45.4 M) as an archaic religious term.

[38] It may be noted in passing that the V of the presumed **dotav[** could conceivably be taken as an L, cf. the L of 8 **kalato | rem**, with relatively elongated second stroke; if so, this might yield e.g. **dotaɭ[ia]**, or another form of *dōtālis*, as suggested (for other quite unacceptable reasons) already by Moratti, *Iscrizione* 8.

not in any way prove the existence of such a form, as Dumézil has pointed out (*Latomus* 29 [1970] 1040, cf. Leumann *LLuF* 94, 451); nor, despite Pahner, does the isolated abl. *praecipe* (Enn. *Ann.* 390 Sk) improve the chances for a **kape* to any appreciable degree.[39]

1.6.b But despite (or perhaps rather because of) the virtual unanimity in both reading and interpretation, there is an important fact about the spelling of this word that is recorded nowhere in CIL, nor in any other modern edition known to me with pretensions to paleographical accuracy and/or completeness: it was explicitly noted already by Comparetti[40] that the **i** of **kapia** was no doubt added to correct an omission. A glance at any of the photographs makes clear the reasons for this observation: even taking into account the somewhat compressed spacing between letters that is characteristic of the third and fourth faces (as against the first and second), the **i** is indeed so closely positioned to the **p** (and to the following **a**) as almost to give the appearance of a ligature; it begins, moreover, slightly beneath the top of the following **a**, and extends below the line — in short, it has clearly been squeezed in beneath the "roof" of the **p**. There seems little doubt, then, that the cutter's first attempt **kapa** was corrected to **kapia**.[41]

1.6.c The originally engraved form **kapa** may of course be nothing more than a simple error. It seems worth noting, however, that a **kapād* corresponds to a characteristic Archaic Latin formation, namely the so-called "root subjunctive" of the type *advenat, tagam,* etc. (Leumann *LLuF* 574f.). Thus it may also be possible to interpret the **kapa** presupposed by the spelling of **kapia** as evidence (although surely not proof) for the existence of an actual subjunctive *kapā-* for this stage of Latin, perhaps already in the process of being replaced by **kapiā-*, or conceivably existing beside **kapiā-* but functionally distinct from it (compare the apparent

[39] See Skutsch *Annals* ad loc. (p. 556) for the possibility of metrical pressure as a factor in the creation of *praecipe,* as also for *praecipem* in Laevius (12 M).

[40] *Iscrizione* 10, cf. Goidànich *L'Iscrizione* 422.

[41] Similarly also Palmer (*King and Comitium* 11: "the *pi* of *kapia* are written, as it were, in the same letter space"), who nevertheless seems improperly to envisage the possibility of an intentional ligature (as he does also for his **duo**, cf. n. 37 above).

"injunctive" specialization of such forms, which seem to be attested primarily in prohibitions, cf. Leumann loc. cit.).

1.6.d The possible existence of a subjunctive **kapā-* in (early-to-mid-) sixth-century Latin might also be of interest for the question of the origin of this formation. Thus C. Sandoz (*Latomus* 41 [1982] 151ff.) sees the origin of this class in original aorist injunctives with state II full grade, to roots with final **-h_2* (thus *tulā-m* = ἔτλη-ν); then, such forms with root-vowel *-ā-* (in historical terms) were apparently reinterpreted as being composed of root plus a modal sign *-ā-*, whence forms like *advenat* etc.[42] Such a theory, to be sure, has some appeal on the syntactic side; but it crucially depends, for its formal side, on the pivotal status of verbs like *tulā-*, for which there is no particular evidence (cf., besides *ad-/per-/ē-venat*, also *attigat, attigās, attigātis, tagam* (cf. Marruc. *ta[g]a* Ve 218);[43] *fuat, fuās; duās* (here note **ceduas** CIL 2841); imperf. *erat*), even assuming that *attulat* and *tulat* themselves are genuine archaisms, which is no more than possible.[44] A sixth-century *kapā-* does not of itself invalidate the theory: it would simply mean that the secondary spread Sandoz and others envision has already been completed by this time, which is after all to be expected if the formation is "Italo-Celtic". Nevertheless, one's confidence in the theory is not bolstered by the possibility that the earliest (indirectly) attested form (if this interpretation of **kapa** is granted) is not the original "pivotal" type, but the allegedly secondary type.[45]

---

[42] Cf. already Thurneysen, *BB* 8 (1884) 284ff., and further N. Oettinger, *Glotta* 52 (1984) 187ff., R. Lazzeroni, *SSL* 24 (1984) 171ff.; see now also McCone *IE Origins* 86, 96, 185 and Eichner "Reklameiamben" 231 nn. 69-70.

[43] Volsc. *atahus* (Ve 222) is generally placed here as well, but see **16.6.c** below.

[44] See Leumann *LLuF* 575 for *attulat* (Pacuv.) and *tulat* (Acc.) as "künstlich".

[45] For a different view of the origin of this formation, see Jasanoff, *IF* 88 (1983) 54ff., esp. 75ff. for the Italo-Celtic data, and more recently *HS* 104 (1991) 86f. with n. 7. See now also McCone *IE Origins* 86ff., with arguments (esp. 90f.) against a unitary origin for the Italic and Celtic **-ā-* morphemes.

1.7 *loi{u}quiod (16)*

1.7.a The reading and interpretation of line 16 are among the most controversial problems of the Forum Inscription, and are central to the two most widely debated (if not widely accepted) analyses of the entire inscription, namely those of Dumézil[46] and Palmer (*King and Comitium*). There are, however, a number of important issues surrounding the interpretation of line 16, both paleographical and linguistic, that are not adequately treated in either theory, or in other interpretations that have been advanced.

1.7.b Although there has been some uncertainty about the reading of the partly damaged initial character (for which L, V, B, and D have all been proposed), the reading L now seems assured.[47] A far more controversial paleographic indeterminacy involves the sign — or sequence of signs — between the first O and the Q, giving the appearance of an I followed very closely by a V, which nevertheless has a small diagonal stroke ascending from its left side.[48]

The least satisfactory analysis is that of von Grienberger (*IF* 30 [1912] 210ff.), according to whom the entire complex represents a single letter, which he takes to be a stylized, ornamental V, whose two strokes are simply doubled in parallel, as is sometimes found in very late inscriptions. This yields a word **loyquiod**, related to *lūcus* 'grove', thus an adjective meaning 'pertaining to a grove', or the like. Palmer, asserting that "Grienberger's epigraphic interpretation and etymology are sound" (*King and Comitium* 26), has accepted this analysis wholesale, and made it one of

---

[46] Most recently *Latomus* 29 (1970) 1038ff. and *Mariages* 259ff.; see CIL p. 853 and *Mariages* loc. cit. for listings of his earlier treatments.

[47] See in particular the analysis by Goidànich, *L'Iscrizione* 427f. (428: "sulla lettura *L* non ci può essere dunque il più piccolo dubbio"). In addition to Goidànich, see also Leifer-Goldmann *Foruminschrift* 72ff. for discussion of the many earlier analyses of this word, with further references. (Note also the unfortunate typographical error LIOVQVIOD in Fedorova's transcription, *Lat. èpigr.* 39.)

[48] The two best photographs of line 16 known to me are those of Palmer (*King and Comitium,* Plate 5), and the original photograph in Boni *Stele* 9 (Fig. 6); in both, the nature of this character (or characters) is clearly visible.

the cornerstones of his reconstruction (*King and Comitium* 26-42).[49] In fact, von Grienberger's analysis is totally unsatisfactory both epigraphically and linguistically. The ornamental technique he assumes (which was never very common) is alien to this period, and is in any case inconceivable in this instance, i.e. in word-medial position, for the second member of a diphthong (!), and in a part of the inscription where space was at a high premium. On the linguistic side: as Dumézil has correctly insisted (*Latomus* 29 [1970] 1039f.), it is scarcely credible that a derivative of *lūcus*, a word without etymological labiovelar, would be spelled **LOVQV-**.

Palmer himself observes that "[t]he serious question arises as to whether the Comitium was ever a part of, or adjacent to, a (sacred) grove" (*King and Comitium* 45). Strangely enough, he arrives at the circular statement that "the best evidence for a grove of the Comitium is the word **louquiod**," concluding rather weakly that "the Comitium may have contained trees enough to constitute a grove" (*King and Comitium* 47). In fact, there is very little evidence to support even this: see on this point A. Drummond, *JRS* 62 (1972) 178.

1.7.c As persuasively argued by Goidànich (*L'Iscrizione* 428f., cf. already Thurneysen, *RhM* 56 [1901] 161f.), the most attractive reading is **loi{u}quiod**, according to which the problematic sequence consists of two letters: the first is clearly an I, and the second is a V; but this V is an anticipatory error for the upcoming V following the Q, and has been "cancelled" by the small diagonal stroke touching its left side. (Compare the other clear corrections: the Q of **quoi** in 13, corrected from Y; the added I of **kapia** in 11, cf. **1.6.b** above; and the double O/Y character in 11, which must somehow involve a correction, whatever its precise interpretation, cf. n. 37 above.) Note especially the interesting observations of Goidànich (p. 429) concerning the stonecutter's care, in making the cancellation mark, not to compromise the I, despite its proximity to the erroneous V — this being, in fact, one of the cutter's probable reasons for not removing the V in some other way (the other reason being the

[49] Solta, similarly, cites the form as *louquiod* (*Stellung* 67ff.), but provides no gloss; likewise Giacomelli *Problemi* 25f., 29, in a discussion of *eulou*.

difficulty of doing so without damaging the extremely close bottom of the S of **IOVESTOD** in the adjacent line 15).

1.7.d The reading **loi{ų}quiod** effectively excludes Goldmann's **ęlo{ų}quiod** 'eloquio' (*ēloquium* otherwise not before Virgil);[50] nor can this be salvaged by omitting the **ę-**, since a deverbal derivative ******loquium* without preverb (as opposed to the type *colloquium, refugium,* etc.; Leumann *LLuF* 294) is morphologically improbable.

A similar objection can be raised against Goidànich's own analysis of **loi{ų}quiod** (p. 448) as a deverbal abstract based on the root of *licet* (i.e., in a meaning something like 'licitatio'): although such *-ium* formations can certainly be found to *ē*-verbs (*studēre : studium, gaudēre : gaudium,* etc.), the full-grade vocalism of **loi{ų}quiod** (under this interpretation) is incompatible with all attested forms of *licēre* and its derivatives, not to mention the absence of other evidence, once again, for a labiovelar.[51] Thurneysen's comparison of **loi{ų}quiod** with *linquō* (cf. perf. *līquī*), comparing further Gk. λοιπός,[52] also faces morphological difficulties. The rare deverbal adjectives in *-ius* (to which I return below in **1.7.g**) share the vocalism of their verbal pendants (thus e.g. *pluvius : pluit,* cf. Leumann *LLuF* 290), which makes it difficult (if not impossible) to justify the full grade of an adjectival ******loiquios* based on *linquō* (cf. *relĭquus, relĭquiae*).

1.7.e Most recently, **loi{ų}quiod** has been explained by Risch (apud Wachter, *Altlat. Inschr.* §26, with n. 168) via Lat. *līcium* 'thread' (but in this meaning usually plural), and especially (one assumes, although this is not made clear) the restricted meaning 'tether', as attested formulaically in conjunction with *lanx* 'platter' in legal regulations concerning theft (e.g. *lance et licio, per lancem liciumque* XII Tab. 8.15, cf. P.F. 104.5 L and Puhvel *HED* [1-2] 348).

---

[50] See Goidànich *L'Iscrizione* 429 on the impossibility of an initial **ę-**, despite some indistinct markings before the L.

[51] The phonological difficulty is noted also by Dumézil (*Mariages* 277) in connection with his critique of Coarelli's interpretation (*PP* 32 [1977] 166ff.), which seems in part (p. 231) to follow the Goidànich 'licitatio' version.

[52] Developed in more detail by M. Warren (*AJP* 28 [1907] 271f.), conjecturing a phrase like **[sakrufik]iod iovestod loiquiod**, cf. Gk. τὰ λοιπά '(sacrificial) remains'.

The connection is phonologically possible, as Wachter notes (*loi- > lī-* : cf. *līber*, Leumann *LLuF* 61; *-qui- > -ci-* : cf. *socius* etc., Leumann 148); but it depends, strictly speaking, on the establishment of a labiovelar for *līcium*, for which there is no evidence. One may certainly assume that *līcium* itself is based on an analogical stem *līc-* (e.g. from a root-noun **līx/*līc-*, cf. *bilīx, trilīx*); but isolated glosses with a stem *licin-* or *līcin-* apparently referring to various textile products (*licinnus, licinae, licinum;* see Ernout-Meillet *Dict.* and Walde-Hofmann *LEW* s.v. *līcium*) diminish the probability of a labiovelar, if these forms are indeed related.

Note finally that the context excludes a collocation with (preceding) *lanx* (f.), if **iovestod** is taken separately from **loi{ų}quiod**, or else (if it is not) gives us the undocumented (and difficult to interpret) phrase **iovestod loi{ų}quiod** 'iusto licio'.

While these considerations do not absolutely exclude Risch's interpretation, they surely leave room for alternative approaches.

1.7.f Before expressing a preference for the comparison with *linquō*, Thurneysen had also mentioned *līquor* and *liquidus* as possible comparanda for **loi{ų}quiod**. It is in fact *liquidus* — specifically in the formulaic augural term *auspicium liquidum* 'clear [i.e. favorable] augury', parallel to *auspicium iustum* 'correct[ly performed] augury' — that forms the basis of Dumézil's analysis of line 16, and his overall interpretation of the inscription as pertaining to certain augural matters. These two phrases, then, are said to appear in a coalesced version **[auispec]iod iovestod loi{ų}qui<d>od** 'auspicio iusto liquido'. Despite certain undeniable attractions, there are problems with Dumézil's actual analysis of the form he interprets as **loi{ų}qui<d>od** 'liquido'.

According to the version of the theory finally preferred by Dumézil (*Latomus* 29 [1970] 1040, 1045, cf. *Mariages* 263), the spelling **loi{ų}quiod** contains not only the erroneous cancelled V-sign, as discussed above, but also a second error, namely the omission of a D before the final OD, whence his **loi{ų}qui<d>od**, which he then equates more or less directly with *liquidus*. In the abstract, this might well be, as Dumézil would have it, "une faute de graphie explicable dans un mot où tant de lettres se répétaient deux à deux", much like the anticipatory erroneous V just mentioned. But in a word which has just undergone a

correction, and in an inscription which shows clear instances of correction elsewhere (cf. **1.7.c** above), it is far more likely that the spelling **loi{ų}quiod** must be taken at face value (rather than assume a second rather crude — and uncorrected — error in the word), and therefore has no direct connection with *liquidus* (or any similarly-formed adjective).

Apart from this epigraphic problem, Dumézil's analysis suffers from a major linguistic objection, as succinctly remarked, for example, by Leumann, in a note on Dumézil's theory (*Glotta* 42 [1964] 84): "**loiuquiod** 'līquidō' (aber *lĭquidus*)"; i.e., the root vocalism shows not only full grade, but *o*-grade, both of which are incompatible with the formation Dumézil envisions. As an alternative, then, Dumézil suggests that **loi{ų}quiod** reflects an actual "doublet" of ***loi{ų}quidod**, citing pairs like *Lūcius : lūcidus, Līvius : līvidus* (*Homm. Bayet* 176f.). But this is no better: one would still expect **liquio-*, not **loiquio-*. Nor does his appeal to the occasional scansion *līquidus* in Lucretius (note 4.1259, with both scansions *lĭqu-* and *līqu-* !) prove anything: this is an artificial and secondary license based on *muta cum liquida* treatments (cf. Sommer-Pfister *Hdbch.* 209).[53]

1.7.g It appears, then, that in order to salvage at least some form of the Dumézilian explanation, one must begin not with *liquidus* (or with any zero-grade formation: apart from the stative set *liquēre : liquor : liquidus*, note the factitive *liquāre*), but rather with the full grade *līquor*.

As already pointed out above (**1.7.d**) in connection with Goldmann's **ęloquiod** (with spurious **ę-**), a deverbal noun in *-ium* without preverb would be difficult to motivate from a thematic verb, whereas a deverbal adjective in *-ius* would correspond to a rare but securely-attested type (cf. *pluit : pluvius* cited above). Nevertheless, the *o*-vocalism of **loi{ų}quiod**, vis-à-vis the expected **leiquio-*, is surprising, and would need to be explained in one of two ways: either (i) the base verb *līquor* actually reflects an *o*-grade **loikʷ-e-tor*, whose *o*-vocalism was still intact at the time *loiquio-* was formed, or (ii) the regularly-formed **leiquio-* was somehow secondarily reshaped to *loiquio-*. The second of these is less

[53] Dumézil's own well-expressed strictures concerning the nature of allowable interpretations continue to be valid: "L'inscription est latine et doit s'expliquer de préférence par des mots du latin historique ou par des variantes archaïques, conformes à un type connu, de mots latins connus."

difficult than the first, there being no evidence, external or internal, that *līquor* continues an *o*-grade, nor any available mechanism (phonological or otherwise) that would convert a normal thematic **leikʷ-e-tor* to a form with *o*-vocalism.[54] Here it may be noted in passing that Dumézil's attempt to explain the *o*-vocalism phonetically, as a kind of coloration of an original *e*-grade due to the following labiovelar, is entirely unconvincing, in the absence of other well-established cases of such a process.

The second type of explanation (**leiquio-* replaced by *loiquio-* secondarily) has certain suggestive possibilities, arising from the actually-attested deverbal adjectives in *-ius* themselves. Here a **leiquio-* (based on a **leiquor* 'dissolve, melt') would fall within a small but semantically restricted set of these (relatively rare) formations, consisting of the two other "liquid" adjectives **flovio-* (> substantivized *fluvius* 'river, stream'), to *fluere* 'flow, drip', and **plovio-* (> *pluvius*, cf. *aqua pluvia* 'rain water' XII Tab. 7.8a), to *pluere* 'rain'.[55] Pressure from **flovio-* and **plovio-* might thus have caused the near-synonym **leiquio-* to be remade as **loiquio-*.[56] Indeed, such an association with **flovio-* might help to explain what must now be taken as a later substitution of *liquidus* for the older **loiquio-* (in the augural phraseology under discussion): the adjective **flovio-* is itself replaced precisely by *fluidus* (also *flūidus*, cf. *līquidus* above); in the same way, as the stative *liquēre* begins to replace *līquor*, the

---

[54] If (as is possible) *līquor* is cognate with *linquō*, and therefore reflects a form like Gk. λείπομαι, an inherited *o*-grade (for example, of the "*molō*" type, cf. 3.5.c) would be that much more difficult to support.

[55] Cf. also *arferia aqua* (P.F. 10.23 L). For the formation, note further *inferius* (Cato *Agr.* 132.2, 134.3, cf. *inferiae*), restricted to Arch. Lat. sacral contexts.

[56] Note that this analysis would depend on the prior completion of *eu* > *ou* in **pleuō* > **plouō* (whence **plovio-*) etc., although this has been questioned: note, for example, Dumézil's [n]**evam** 'novam' for line 6 (*Latomus* 29 [1970] 1043 n. 7), as well as forms like (Fal. ?) **Neven** (CIL 455 = Ve 364b) from Ardea, cf. Tor Tignosa **Neuna** (CIL 2845-6). But despite Dumézil (op. cit. n. 3), the *s*-stem basis of **iovestod** is not likely to have an inherited *o*-grade, thus calling into question his [n]**evam**; and the phonetic and orthographic indeterminacies of the problem are rather more complex than appear, for example, from Coleman's assertion (in *IE Numerals* 412) that Proto-Italic **neunos* is "still surviving" in **Neuna**. See now Wachter, *Altlat. Inschr.* §171c, who argues for an intermediate stage */əu/* or */ōu/*, which could have led, for a time, to chronologically discontinuous attempts to record such a diphthong via both **eu** and **ou**, including preservation of **eu** in divine names and the like (on the last point, see already G. Giacomelli *Lingua fal.* 121 n. 33 and R. Giacomelli *Problemi* 28 on **Neven/Neuna** and Carm. Sal. *Leucesie*, and more recently Eichner "Reklameiamben" 224 n. 34 §i); similarly also D. Steinbauer apud Meiser *Lautgesch.* 37, followed by Schrijver *Laryngeals* 451f.

old **loiquio-* (already **līquio-* ?) would have been ousted by the productive pendant adj. *liquidus* to *liquēre,* whence *auspicium liquidum* for older **avispeciom loiquiom.* It is interesting to note, incidentally, that under such an assumption, the original "etymological" sense of the phrase was not what it appears to be on the basis of *liquidus* (i.e. 'clear = favorable', cf. *liquet*), but rather something more closely related to the meaning of *līquor* 'melt, dissolve', the exact sense of which (in terms of the augural reference of the phrase) may be impossible to recover; a later folk-etymological substitution of *liquidus,* in view of its actual liquid sense (in addition to derived meanings like 'clear, evident'), cf. also *liquāre* 'melt, strain', does not seem to be a problem.

If, then, the reading **loi{ų}quiod** is accepted, and if it is taken at face value (as I believe it must be), the attractive contextual assumptions of Dumézil's overall analysis may be retained by means of a revised morphological analysis of the form along the lines just proposed, but not via direct comparison with Lat. *liquidus.*

CHAPTER TWO

The Corcolle Altar Fragments

2.1 *Introductory*
2.2 *BI + CI and A2 (Preliminary Considerations)*
2.3 *On Spacing and the Restoration of BI + CI*
2.4 *Problems in the Reading and Interpretation of B4 + C4*
2.5 *Further Notes on A2 and the Nature of the Text*

2.1 *Introductory*

2.1.a The so-called "Corcolle altar fragments" (CIL 2833a, p. 858), with an inscription of more than seventy characters (including word-dividers) datable to about 500 B.C., were first published by A. Morandi in 1978, with transcription and brief commentary.[1] The three fragments ("A", "B", and "C", each with four lines of broken text) were subsequently subjected to a brief paleographical analysis by G. Colonna (in *Lap. Sat.* 45ff.), and then to an extended study by A. L. Prosdocimi.[2] Prosdocimi's study forms the basis of Wachter's brief treatment (*Altlat. Inschr.* §37), as well as the CIL presentation. In 1991, I published a detailed discussion of the fragments,[3] with linguistic and paleographical commentary on a number of points raised by Prosdocimi's transcription and interpretations, and several proposals for new readings and restorations. In a *Korrekturnachtrag* to that paper ("Notes" 233), I acknowledged an important new contribution to the subject by Morandi,[4] which became available to me only during proofreading of my 1991 paper.

---

[2] In "Studi sul latino arcaico", *SE* 47 (1979) 197ff., here cited as "Studi 1979" (photos: Tavv. 49-51; photos 50b and 50c are mislabeled [their order is reversed], as is 51a, which represents frag. C, not B).

[3] "Notes on the Corcolle Altar Fragments", *Glotta* 69 (1991) 219ff., here cited as "Notes".

[4] "L'ara inscritta di Corcolle. Aspetti monumentali ed epigrafici", *RBPh* 65 (1987) 97ff., with extensive photographic documentation; hereafter cited as "Ara".

2.1.b The signal advance of Morandi's more recent work, as reported in his 1987 paper, was his convincing reconstruction of the actual disposition of the fragments one to another. Together with his reconstruction of the altar pieces, Morandi presented detailed descriptions of the characters of the inscription and provided a discussion of their interpretation, a revised transcription, and some interpretive commentary.

Naturally, Morandi's "ricomposizione" has far-reaching significance for the interpretation of the text itself. Hitherto, for example, Prosdocimi had argued convincingly for the order B + C, given the large space at the end of C4 (apparently the absolute end of the inscription); but the position of fragment A was less clear: although it seemed to precede B and C, it was uncertain whether it preceded them directly. Indeed, two of the restorations I proposed (see "Notes" 225ff.) were based on the assumption that A directly preceded B. Morandi's reconstruction now shows this to be incorrect, and so these restorations must be abandoned: while A does in fact precede B, it does so at some distance, while B falls directly before C.

2.1.c There are also, however, some independent convergences between my conclusions and those recently arrived at by Morandi, of which the most striking was already acknowledged in the *Korrekturnachtrag* to "Notes", i.e. Morandi's restoration of the verb form]x̣**icase** at C1, comparable to my]j̣[ą]**se** ("Notes" 224f.), for earlier]j̣**--se**. Among other independent parallels might be noted Morandi's **poplx**[for A1 (cf. my remarks at "Notes" 222 with n. 9, against Prosdocimi's suggestion that **popl** could be taken as an abbreviation),[5] Morandi's observations that (pace Prosdocimi) A3 **fra**[need not be a form of *fratres*, and A4 **uj̣d**[need not be a form of *vidua* ("Ara" 107, 111, cf. my discussion along similar lines, "Notes" 230f., with alternative suggestions for both items),[6] and Morandi's restoration]**n:** (vs. Prosdocimi's more conservative]**-:**) for the beginning of A2 (cf. my

[5] See further **2.5.c-d** below for more on this form.
[6] See also n. 23 below for more on **fra**[and **2.4.d** below for more on **uj̣d**[.

suggestion **[flame]n:**, *exempli gratia,* "Notes" 230, with discussion of the character trace in n. 35).[7]

2.1.d But beyond those areas in which I willingly abandon mistaken assumptions on the basis of Morandi's findings, and other areas in which I acknowledge with pleasure our concurrent views, there remain several major points where our analyses diverge, and in which I believe there is room for further discussion. This is only natural for such a fragmentary and difficult text, and constitutes, I would claim, one of the main avenues for future progress in its interpretation, barring extreme circumstances (such as additional fragments, or duplicates, yet to be unearthed). I offer, then, the following explanatory (and partly, under the circumstances, exploratory) notes on these areas of disagreement. As will become clearer shortly, some of the proposals advanced here depend in no small way on some of the significant progress effected by Morandi in our understanding of this text.

2.2 *B1 + C1 and A2 (Preliminary Considerations)*

2.2.a It will be convenient to begin by providing, as a basis for discussion, Morandi's transcription of the sequence B1 + C1 ("Ara" 109):

B1 + C1 **[---]x:iouo:[---:]x̣case:?[---]**

Of fundamental importance is Morandi's highly plausible suggestion ("Ara" 107f.) to read **iouo** in B1, with initial I, for what had hitherto been read (since Morandi's 1978 edition) as **ɥouo**, with inverted V as the first letter (cf. **3.1.c** below on inverted V). Inspection of Morandi's reproductions (see Fig. 5 and Plate II) reveals, in fact, that the alleged left stroke does not

[7] Among relatively minor differences: Morandi's tendency (like Prosdocimi's) to view *-os* as consonant-stem gen. sg. forms ("Ara" 109f., cf. "Notes" 229ff. on this point, but also n. 25 below); and his rejection of a connection between **muliar[** and *mulier* ("Ara" 112), with the further suggestion (qualified, to be sure, as "estrema ipotesi") to take the form as a passive infinitive in *-ari* (cf. my discussion of the problem, "Notes" 228f., to which additional nominal material could be added, e.g. Ven. *vo.n.ta.r., augar,* cf. Lejeune *MLV* §77.13).

reach the top of the right stroke, and seems also to be distinctly shallower than the right stroke, both features tending to support Morandi's judgment that this is a chance abrasion. Moreover, the appearance of two such different forms of V in the same word, separated by only a single character, was surprising, to say the least.[8] Consequently, the rather tortured speculations, on the part of both Prosdocimi and myself, as to how to derive a form **ụouo** from something ancestral to *voveō* or *vōtum* can probably be safely put aside. But if the initial **i-** now seems assured — thereby not only eliminating the difficult inverted V, but also yielding a **iou-** that acquires support (as Morandi notes) from A2 **iouos** — the resulting word **iouo:** (according to Morandi's transcription) nevertheless raises severe (and in my view insuperable) difficulties with regard to its ending.

2.2.b According to Morandi ("Ara" 110), **iouo:** is a dat. sg. *Iovo* 'Iovi', to whom the altar is allegedly dedicated, while **iouos** in A2 **]n:iouos:l[** gives a gen. sg. *Iovos* 'Iovis' of the same theonym (which Morandi, like Prosdocimi, sees also in B4 **]ioụe[i]ai[**, on which cf. **2.4** below), in a phrase such as **[i]n:Iouos:l[oucod]** (sic; perhaps rather **[e]n** for this period). But there are two problems of a linguistic nature with this interpretation (one phonological, one morphological), and in addition a paleographic indeterminacy that admits of an alternative solution.

2.2.c The first problem concerns the unexpected initial **I-** for **Di-** in these forms taken to be based on a stem **Diov(o)-*. I am not convinced by Morandi's claim that the fourth-/third-century Praenestine **Iouos** (CIL 563) allows for the possibility of a late sixth-/early fifth-century form with initial **I-**: as I have discussed ("Notes" 226) in connection with similar suggestions by Prosdocimi, the remaining fourth-/third-century evidence (CIL 361 **Diouis**, 39 **Diuei** = /D̨iu̯ei/ [Wachter *Altlat. Inschr.* §170], 60 **Diouo**, 558 **Diouem**, etc.) strongly indicates that **Diou-** would be expected for this period (i.e. at least a century — if not almost two

[8] I had attempted to mitigate this difficulty with my analysis of what Prosdocimi took to be the characters **uọ[** inscribed adjacent to this word ("Notes" 223f.); but these markings may not in fact be letters at all, and in any case must now be positioned differently with respect to the three main fragments (see Morandi "Ara" 104).

centuries — earlier than Praen. **Iouos**). Wachter, to be sure, shows that Praen. **Iou-** was in use by at least 300 B.C., and that its appearance (beside **Diou-**) in the early bronzes probably reflects current pronunciation, with **Diou-** a "traditional" spelling (*Altlat. Inschr.* §§46c, 110i, 112a, similarly 213a on CIL 361); but the strength of this tradition was still considerable in the late fourth/early third century, such that **Diou-** must surely be assumed for approx. 500 B.C. (cf. similarly Meiser *Lautgesch.* 159f. on the chronology of the comparable process in Oscan and Umbrian).

Morphologically, it would be surprising to find a text with a "heteroclitic" declension for this theonym, showing both an *o*-stem dat. *Iovo* (presupposing a nom. *Iovos*), and a consonant-stem gen. *Iovos*, as Morandi's analysis seems to claim. This oddity could be removed simply by taking A2 **iouos** as nom. *Iovos*, and not gen.; but the fact remains that thematic inflection for this word is not only unexpected, but without significant support for the archaic period. The late **Ioυo** of CIL VIII 8247, even if correctly read and interpreted as a thematic dat. sg. (see Morandi "Ara" 110, with further references in n. 53), is of almost no value for this question, leaving the aforementioned early Praenestine **Iouos** of CIL 563 as the sole basis for an archaic thematic **Diovo-*. But even if this form is nominative (as in fact seems probable), its evidence is weakened by other considerations, and the form can be interpreted differently, as will be discussed in Chapter **5** (see **5.5**). Note finally that, despite Morandi, B4 **ioυe[i]ai** provides no support for a thematic **Diovo-* ("Riconosco la medesima base tematica in *ioue[i]ai*"): it is not clear that such a form is directly comparable to *Iovius*, which in any case shows a formation not restricted to thematic bases. (See further **2.4** below on **ioυe[i]ai**, for which I offer an entirely different analysis.)

These reservations, then, considerably weaken the hypothesis that B1 **iouo** and A2 **iouos** are forms of **Diov-*/**Diovo-*; and the fact that a cult of Jupiter might have been particularly associated with this area (cf. Morandi "Ara" 110) should not be allowed to prejudice the purely linguistic considerations just presented. The evident conclusion is that both

forms must be based on the unsyncopated *s*-stem **iouos* underlying *iūs* (cf. CIL 1 **iouestod**, 4 **iouesat**).[9]

2.2.d The presumed nom./acc. sg. **iouos* could be directly attested in A2 **iouos** (cf. **2.5.a** below for a slight adjustment); but it appears impossible to explain the form **iouo:[** of B1 on the basis of an *s*-stem **iouos*, assuming that the word-divider after the second O is assured. In fact, it is not: the state of preservation of the fragments ("veramente disastroso"; Morandi "Ara" 106) is such that their extremely pock-marked surfaces render the identification of word-dividers (among other characters) highly uncertain. In this particular case, Prosdocimi (working from autopsy) had already raised doubts as to whether the two depressions in question (among the group of seven or so clearly visible in Morandi's reproductions) after his **ɥouo** (here **iouo**) were in fact word-dividers, hence his transcription with question-mark after the colon (cf. my discussion of this point, "Notes" 222). I suggest, then, that B1 ends not with **iouo:[** but with **iouo[** (i.e. **iouo[s(-)**), which may derive further support from certain facts related to spacing, to be discussed in the next section.

2.3 *On Spacing and the Restoration of B1 + C1*

2.3.a The analysis of two forms of spacing in this inscription is as yet underutilized, although both have something to offer in the interpretation of the document. The first concerns patterns of spacing between letters and words, and the second concerns information now available, thanks to Morandi's reconstruction of the relative positioning of the fragments, about spacing between fragments B and C. As for the first, there are certain regularities to be observed that may be helpful in evaluating the likelihood of **iouo:[** vs. **iouo[(s-)**, despite blanket statements that letter spacing in this inscription is "uneven" (cf. n. 24 below); and as for the second, Morandi's conventionalized notation "[---]", in his transcription, for all of the spaces between B and C (whether or not

[9] For a recent extended discussion of *iūs*, see A. Magdelain, "Le *iūs* archaïque", *MEFRA* 98 (1986) 265ff., hereafter cited as "iūs".

three characters are missing) obscures the progress he himself has made in determining these distances with some precision, which may in turn allow for the restoration of the first complete words (including a finite verb form) to be found in this text, as I will suggest below.[10]

2.3.b Space between characters on fragment A, where the lines proceed more or less horizontally (unlike on B, as discussed directly below), is relatively uniform; thus, corresponding to the horizontal space occupied in A1 by the sequence

poplx[(5 characters)

we fmd likewise

A2 **iouos** (5 characters)
A3 **os:fr** (5 characters)
A4 **os:uj** (5 characters).[11]

The technique of fragment B is entirely different, since the inscription at this point "turns the corner" and continues in semi-circular fashion towards fragment C, where the layout is again more or less horizontal. Although each line of B follows the same curvature, the letter spacing becomes progressively more compressed: thus, corresponding to the curved sequence

B1 **iouo** (4 characters)

we find (utilizing, for the moment, Morandi's transcription of B4, which will be adequate for present purposes):

---

[10] In principle, it is now also possible to estimate (very roughly, to be sure) the number of characters missing between fragments A and B, a task which I leave to others; the rather large break between A and B is in any case clear.

[11] The parallel spacing of A2 and A3 is discussed further below (**2.5.a**), as is the problematic **j** of A4 **uj**d[(**2.4.d**).

B2 **od:ora** (6 characters)

B3 **muliar** (6 characters, of which the broad M occupies a "double space" corresponding to B2 **od**)

B4 **e[i]ai:ne** (7 characters).

Moreover, if one examines the sequence B I **iouo** more closely, it is evident that the letter spacing — here already the broadest on this face — in fact *increases* from one letter to the next: measured from the mid-point of each letter, the space between **I** and **O** is markedly shorter than the next space between **O** and **V**; and the next space (between **V** and the second **O**) is at least this long, if not slightly longer; thus roughly (without, of course, representing the curvature)

I O V O

Given this expanding format, then, the next character might well have appeared in the break itself, providing an argument in favor of

I O V O [

= **iouo[** (allowing for **iouo[s(-))**, and against taking the dot-like abrasions directly after the second **O** as word-dividers, i.e. Morandi's

I O V O :[

= **iouo:[**.

2.3.c In evaluating the space between B I **iouo[** and the beginning of C1, it is important to note that Morandi's transcription **[---:]x̣icase** (for the space after B1 **iouo[** and C1) is somewhat misleading, in two respects (apart from the conventional use of **[---]**, as already discussed): (i) as is clear from the photographs (cf. also the explicit description, "Ara" 108), the first visible character is actually the (damaged) **i̯**, not a preceding trace **x**, and (ii) the word-divider is entirely arbitrary (perhaps related to Morandi's tentative suggestion **[d]i̯case** ("Ara" 108f., comparing CIL 1439

aara | leege.Albana.dicata[12]). What must be considered, then, without prejudice as to word-division, is the actual space between B 1 **iouo[** and C 1 **]icase**. This space is in fact exceedingly short, allowing for no more than one or two letters; indeed, in the case of two letters, one of them might well need to be narrow, which in terms of the paleography of this inscription includes both I and S.[13] An attractive solution, I suggest, would therefore be **iouo[sd]icase** 'iūdicāre/iūdicāsse'. It is worth noting that among the forms of this verb attested in legal contexts, the pres. infin. **iudicare** itself appears prominently in formulaic usages, as early as CIL 583 (Lex Repetund.):

583.47 **iudicare.[iubeto]**
cf. 592.I.16-17 **ita.ius. | deicito[.]iudicia.dato.iudicareque.iubeto**
592.I.19-20 **ita.iudicium | datum[.]iudicareve.iussum**
592.I.22 **itaque.iudicare.iubeat**
592.II.57-8 **iudicia[.]dato.iudicare | iubeto**
594.III.2.3-4 **dati.iussive.e | runt.iudicare**

and somewhat differently 583.49 **[iudice]s.quei.iudicare.negarint**, cf. 583.48 **[negare.iu]dicare**.

2.3.d Such a restoration would have interesting consequences for the morphology of *iūdex* (the basis of the denominative *iūdicāre*, which according to this interpretation would be quite old, as is perhaps to be expected).

The precise nature of the first member of *iūdex* is not made clear by the proximate reconstructions generally found in the handbooks, of the anachronistic type **iūs-dik-s* (e.g. Niedermann *Phonétique* 154, Monteil *Eléments* 179, 298) or (with more archaic orthography, but still morphologically ambiguous, if not also anachronistic) **ious-dik-s* (e.g. Walde-Hofmann *LEW* s.v., Sommer-Pfister *Hdbch.* 182, Leumann *LLuF* 94, 205). The matter is not discussed by Bader, who nevertheless observes, in connection with *iūdex* and similar forms (*Composés* 58), that the

[12] Cf. also Livy 1.7.11 (*ara condita ac dicata*), 1.20.7 (*Iovi Elicio aram in Aventino dicavit*), etc.
[13] "Narrow S" in this inscription is discussed in greater detail below (**2.4.d**).

analysis of the parallel term *vindex* (XII Tab. +) in terms of a first member acc. *vīm* would be "irregular" for Latin, since inflected forms are generally not found as first members of compounds, except under restricted circumstances, such as univerbated phrases and the like (cf. *Composés* 14: *manuminiectio* etc.; similarly e.g. Ernout-Meillet s.v. *uindex:* "la forme fléchie d'un premier terme de composé est étrange"). Leumann, in his discussion of archaic compounds without composition vowel (*LLuF* 390f.), sets up **ioues-dik-* (apparently followed by Benedetti *Composti* 81), and refers explicitly to the oblique stem **ioues-* of *iūs,* as attested in CIL 1 **iouestod**. The form **iouo[sd]i̯case**, however, if accepted, would suggest **iouos-dik-,* with first member acc. **iouos* (unless one wishes to appeal, gratuitously, to a vowel-assimilation **ioues-* > **iouos-*), to which **uīm-dik-* would be exactly parallel.[14]

If not for the suggestive parallel of *vindex* (cf. also **2.5.a** below for additional possible support for **iouo[sd]i̯c-**), one might also entertain the possibility of a restoration **iouo[d]i̯case**, which would likewise be morphologically interesting; the basis **iouo-dik-s* would then reflect a "thematic" form of suffixless consonant-stem first member of the type **homo-* (as in *homicīda,* cf. **nōmi-cap-* in *nuncupō, foedifragus, opificīna,* etc.), as conjectured by Bader at least for *homicīda* (see *Composés* 17f.). In such cases, of course, the original nature of the composition vowel (which could also be **-i-*) cannot strictly be determined, without pre-vowel-weakening forms such as **iouo[d]i̯case** might provide.

A final gloss on *iūdex, vindex* concerns the unexpected *e*-vocalism of the final syllable of their nom. sg. forms (for expected ***-dix*), which is said to be analogical after forms like *artifex* (*-fic-*), where it is regular (see e.g. Leumann *LLuF* 94, Benedetti *Composti* 79f.). This might be easier to understand if there existed a parallel (and synonymous, or functionally

[14] On *vindex/vim dicere* and *iudex* see now also Magdelain "iūs" 283f., 316, who accepts the etymology of *vindex* with acc. first member ('celui qui montre et dénonce la violence d'un tiers à l'encontre de sa victime'); similarly Benedetti *Composti* 84ff., esp. 88f. for the etymology (accepted also by Forssman, apud Benedetti *Composti* 7). A similar account seems implied (although it is not made explicit) for *iudex,* in Magdelain's discussion of *ius dicere* and *ius facere* (together with *iudex*), 314ff., for which see now also Benedetti *Composti* 80ff. For an entirely different account of *vindex,* see Szemerényi *Quellen* 79.

equivalent or overlapping) **i̯eu̯os-dhh₁k-s* (cf. Av. *yaož-dā-* ?)[15] > **iouosdaks*, i.e. **i̯eu̯os-dhh₁k-s* 'celui qui fait/propose la formule' (?) beside **i̯eu̯os-dik̂-s* 'celui qui montre la formule'. After syncope and vowel-weakening, such a **iouosdaks* (regularly > *iūdex/iūdicis*) would have fallen together with **iouosdiks* (> **iūdix/iūdic-*) in all forms but nom. sg.; the two terms would then have coalesced, with the nom. sg. *iūdex* retained on the pattern of *artifex*, and especially such terms as *auspex, haruspex*, etc.

2.4 *Problems in the Reading and Interpretation of B4 + C4*

2.4.a Morandi transcribes B4 + C4 as follows:

[---:]ioṷe[i]ai:ne[---]tod[... ?][16]

Quite apart from the unlikelihood of **:]ioṷ-** (as opposed to **:D]iov-**, cf. **2.2.c** above and "Notes" 232), there are serious problems with the reading of B4, not all of which are apparent from the two indeterminacies signaled in the transcription (i.e. **ṷ** with sublinear dot, and the bracketed **[i]**). As with B1 + C1, there is also the question of the space between the end of B4 and the beginning of C4; this being relatively clear, it is most convenient to begin with this point.

The space in question would have contained two or (at most) three characters. This is in accord with Morandi's judgment: since he reads **:ne[** as the last legible word before the break (more on this point below), he concludes that in the space directly following "si darebbe l'integrazione dei due punti e di due lettere" ("Ara" 108). One could thus consider, for example, a phrase like **:ne[:es]tod**.[17] The most serious problem with **:ne[:es]tod**, however, is that the reading **:ne[** is itself quite uncertain —

---

[15] For discussion of *iūs* and the Indo-Iranian comparanda see esp. Benveniste *Vocab.* 2.112ff. and Magdelain "iūs" 306f.; cf. also *ius facere*, although this seems generally to refer to the plaintiff (Magdelain "iūs" 314ff.).

[16] The text of the inscription probably ends with **]tod**, which is followed by open space; nevertheless, **]tod** is directly followed by a small break, in which several letters might possibly have existed (see Morandi "Ara" 109).

[17] Morandi tentatively suggests **:ne[:faci]tod** ("Ara" 112), but this contradicts his own observations about the available space.

one of the troubling uncertainties about the reading of B4 just alluded to, and to which I now turn.

2.4.b As Morandi notes ("Ara" 108), "La quarta riga si presenta molto danneggiata" — clearly the source of much of the uncertainty. It will be important, then, to consider in some detail the reading of each character, for which Morandi's important descriptions from autopsy must be cited in extenso. The characters in question will be referred to on the basis of the following numbered sequence, which corresponds in all essential particulars to the standard transcription of B4 found in Prosdocimi, CIL, Wachter, and Morandi:

] **I O Ṿ E [I] A I : N E** [
1 2 3 4 5 6 7 8 9 10

2.4.c (1, 2, 3, 4): "Alle prime due lettere, *i* ed *o*, seguono dei tratti che soltanto l'evidenza del successivo *e* (pertanto del contesto linguistico) ci sollecita a leggere come *u*". Indeed, the reproductions show significant damage between O and E, but **V** does seem to match the visible traces (better than, say, C), and provides a reasonable sequence **IOVE-**.

2.4.d (5): "Dopo *e* non è assolutamente rintracciabile la *i* data dal Prosdocimi con tratto pieno, che andrebbe restituita perciò con lo stesso criterio di *u*". Here the situation is somewhat worse, if anything, than with Ṿ: the damaged area after E is so complete that an I is not actually certain. What is clear, however, is that the damaged area is relatively narrow (see especially Morandi's Fig. 5); it seems to me equally probable, then, that the character in question is [S], and not [I], since the S used in this inscription is otherwise extraordinarily narrow, and in some cases virtually identical to I, as is especially clear on Fragment A (esp. A2 **iouos**, A3]**os**, cf. Morandi's Fig. 3).

It is particularly interesting, in this connection, to consider Morandi's comments ("Ara" 107) about the alleged I of what Prosdocimi had taken to be A4 **uid[**: "Sulla quarta riga si ha la finale *]os* e quindi l'inizio di una parola, *uị d[*, che pone un notevole problema di lettura

riguardo al secondo segno, nella mia edizione precedente reso nell'apografo con una forma piuttosto serpeggiante. ... Allo stato attuale non mi sento di convenire con il Prosdocimi che dà la sequenza *uịd[* come sicuramente ricomponibile in *uid[ua]*. L'osservazione più accurata mi conferma nei dubbi di allora: il segno è una sorta di S schiacciata; la presenza di una minuscola appendice anche sotto le altre due lettere non giustifica un allungamento abnorme della presunta *i*." In view of the clear "appendice" at the base of what otherwise looks like a D (and in the absence of a reasonable interpretation for a sequence **VṢD[**), perhaps the best solution is to read **VṢQ[** (i.e. *usque* or *usquam*). However this may be, it seems legitimate to propose S (or "S schiacciata") for character (5); and since the A of character (6), although damaged in its left half, seems clear, this would yield not **IOVẸ[I]A** but **IOVẸ[S]A.**

Now **ioue[s]a**, unlike the previously-assumed **ioue[i]ai**, is a perfectly transparent form, i.e. the (pre-rhotacism and unsyncopated) nom./acc. pl. of precisely the *s*-stem **iouos* apparently attested at A2 **iouos**, and conjectured (as the first member of a compound) for B1 **iouo[s-** (**2.3.c** above). An evident difficulty, however, concerns the lack of a word-divider after the A. The remaining characters (7-10), transcribed as I:NE, would appear to provide yet another (and apparently intractable) difficulty; but these characters, as it happens, are the locus of still more serious problems, requiring detailed consideration.

2.4.e (7-10): "Poi [i.e. after A] si legge chiaramente *i*. Ciò che segue è alquanto imbarazzante. Come può vedersi dalla foto fatta eseguire appositamente (pl. III,1), dopo la *i* parrebbe individuabile sulla superficie un segno di forma ovale piuttosto che tondeggiante, cui seguirebbe V ed E; la successione indicata dovrebbe portarci a qualcosa come *ioue* (*ixue* nella protoedizione)." All of this is quite clear, for example, from Morandi's Fig. 5: the word-divider designated above as character (8) has no real existence, and character (9) appears to be a V, such that the sequence after the A reads simply IOVE. The traditional transcription I:NE, then, is actually a kind of *emendation,* based on several factors, not least among them the desire to see in **]ioụe[i]ai** a feminine form of an adjective similar to *Iovius*. A second rationale concerns the nature of what appears here in character (8) to be an O: by and large, this inscription makes use of the

small circular O typical of archaic styles, while the present letter does indeed have a somewhat more modern, oval appearance; hence Morandi's reservations: "Sopratutto la forma di *o* ... fa sorgere i più seri dubbi ... Una *o* di siffatte dimensioni e forma pare infatti troppo isolata nel contesto della scrittura arcaica, e non solo latina." But these concerns strike me as exaggerated. The lettering style of this inscription is notably irregular, and O is no exception: there is in fact a considerable variety of O-forms in terms of both shape and size, and it seems to me eminently credible that such an engraver could have produced, on this one occasion, the rather modern-looking specimen just described. Such a regularly-formed circular depression is in any case unlikely to result from a chance abrasion, occupies precisely one letter space, and is followed by a V; the reading IOVE therefore seems inescapable. For the whole of B4, then, I propose to read **]ioụe[s]aioue[**, i.e. **]ioụe[s]a()ioue[**.

2.4.f We are now in a position to return to the question of the restoration of the gap between B4 and C4 **]tod**, which (as discussed in **2.4.a** above) is likely to require a minimum of two (and a maximum of three) characters. Having just argued against the traditional reading **:ne[** at the end of B4, the first approximation **:ne[:es]tod** (offered above for expository purposes) is seen now to be impossible. If the sequence **]ioụe[s]a()ioue[** is accepted for B4, the only possible restoration appears to be **[sa]**, which would yield the interesting phrase **]ioụe[s]a() ioue[sa]tod**, i.e. 'iura iurato' (for **iouesa-** 'iūrā-' cf. CIL 4 **iouesat**). This sequence would provide the "missing link" *ius/iura iurare* generally invoked to explain the univerbated phrase *ius iurandum* 'oath', a link which nevertheless (as Benveniste pointedly notes, *Vocab.* 2.112) is not otherwise attested.[18] Indeed, the lack of a word-divider after **ioụe[s]a** is perhaps a telling (and not unexpected) feature, indicating that the univerbation of this etymological figure had already begun by this time. If so, the original finite usage **iouos/*iouesa *iouesā-* might well have been replaced relatively early by the simple (and less redundant) denominative **iouesā-* alone (hence the predictable absence of later examples of *ius/iura iurare*),

[18] On *iurare* and *ius iurandum* see now also Magdelain "iūs" 307ff., as well as 314 on the technical sense of the plural *iura* 'legal formulations', still retained as an archaism in phrases like *iura dare* (Livy, Virgil) and *iurum fictor* (Plt. *Epid.* 523).

with *ius iurandum* the only relic (exactly what it appears to be, cf. Risch *Gerund.* 66f., 163) of this original phraseology.[19] Note, finally, that among the various forms of *iurare* actually found in archaic legal documents, *iurato* itself (also pl. *iuranto*) is among the best-attested:

CIL 583 (Lex Repetund.)
15 **iuratoque.sese[**, cf. 18 **iouratoque.sese.eos.** etc.
21 **edito.[i]ouratoque**

CIL 582 (Lex Bant.)
16 **iouranto [utei.i(nfra).s(criptum).est]**
17 **apud.q(uaestorem).iouranto**, cf. 24 **[i]ouranto.apud. quaestorem**

CIL 585 (Lex Agr.)
42 **sed.fraude.sua.nei.iurato**[20]

2.5 *Further Notes on A2 and the Nature of the Text*

2.5.a For Prosdocimi's A2 **iouos̩[** or **iouos̩[** (discussed at "Notes" 226), Morandi now transcribes **iouos:l[**, and comments ("Ara" 107): "Il segno sulla frattura presenta alla base un trattino obliquo verso destra, da ciò è quasi certa l'identificazione del segno come *l*." The "trattino obliquo" in question is indeed visible in Morandi's reproduction (Fig. 3, cf. also Plate III), but there are several qualifications to be made. First, note that Prosdocimi did not take the depressions after the S to be word-dividers, and indeed, the letter taken by Morandi to be L is quite closely spaced after the S: it lies directly above the A of A3 **fra[**, and it is clear that in general, word-dividers in this text are accorded more space — indeed, up to a full letter space, as in fact occurs in A3, where the word-divider occupies a full letter space beneath the V of A2 **iouos**, as follows:

---

[19] Interestingly, the process eventually repeated itself, cf. *ius iurandum iurare*, here extended with *iurare me iurasse* (!): *magna voce iuravi verissimum pulcherrimumque ius iurandum, quod populus idem magna voce me vere iurasse iuravit* (Cic. *Fam.* 5.2.7).
[20] See Magdelain "iūs" 297ff. for a discussion of such imperatives in legal formulations.

A2] Ṇ : I O V O S Ḷ [
A3] O S : F R A [

Note also that apart from the left vertical and the (beginning of the) "trattino obliquo" (slightly curved?), the rest of the letter space of this alleged Ḷ is damaged (i.e. falls within the "frattura" referred to above); it therefore seems equally possible that the character is not L, but D, yielding still another **iouosḍ[ica-** form (or, if one insists on taking the depressions after the S as word-dividers, perhaps **iouos:ḍ[eic-**, cf. *ius dicere*).

2.5.b It should be noted that the forms tentatively identified above, namely B1 **iouo[sd]ịcase** (perhaps also in A2 **iouosḍ[**) and B4 + C4 **ioıɹe[s]a()ioue[sa]tod**, would comprise the only complete words so far extracted from this text, beside more or less recognizable fragments like A1 **poplx[**, B2 **oraṭ[**, and ambiguous or controversial bits like A3 **fra[**, B3 **muliar[**, etc. Needless to say, these complete words, if they have been correctly identified, would have an obvious bearing on the problem of characterizing the nature of the text. Towards this end, Morandi ("Ara" 102f.) has collected the evidence of other early altar inscriptions from Latium. But it must be admitted that the results of this comparison are negative; nor is this unexpected, in view of the fact that the positioning of the inscription on the Corcolle fragments is entirely different from that of the other altar inscriptions, as Morandi himself has pointed out ("Ara" 103), with the result that "l'iscrizione di Corcolle reste dunque una evenienza del tutto isolata e in certo qual modo inspiegabile". The text, moreover, is clearly of considerable length, and in this sense also not comparable to the brief inscriptions collected by Morandi.[21] Especially in view of the possibilities for a **iouosdica-** and a **iouesa-** discussed above, I continue to believe (cf. the various comparanda adduced in "Notes" passim) that Prosdocimi's general conception of the text was correct, i.e. that it is essentially legal (which may include religious injunctions) rather than

[21] The same observation applies to the third-century altar fragment from Rome CIL 2838 (Degrassi *ILLRP* 119), for some reason omitted from Morandi's survey: despite the lacunae, it is clear that the general structure of this text (on which see **7.6.f** (v) for more detail) corresponds to one of the standard short dedicatory formats.

simply votive or dedicatory (cf. Morandi "Ara" 109: "prescrizioni in relazione al monumento, alla iscrizione stessa e all'area templare").[22]

2.5.c As a final phraseological note: A1 **poplx[** need not be an adjectival **popḷ[c-** 'publicus', joined with **]x̣icase** "come parti della intestazione di una dedica di carattere pubblico" (Morandi "Ara" 111). In view of the above remarks, one could also argue for a nominal form of *populus*. The collocation of *iudicare* with forms of *iubeo* is formulaic, as was especially clear with the **iudicare** attestations listed above (**2.3.c**); as a basis for further comparison, consider the following slightly expanded versions of two of the passages already cited:

CIL 5̊92.I.19-20 **quod.ita.iudicium | datum[.]iudicareve. iussum.iudicatumv[e].erit.[ilus.ratumque.esto**

CIL 582.23-4 **quibus.quisque [eorum.sciet | hance.legem. popolum.plebemve.iousisse.ilouranto.apud.quaestorem**

Much the same phraseology is traditional with statements of popular approval (i.e. with *populus*) required under certain circumstances, and sometimes explicitly noted as a preliminary to legal or religious formulations: e.g. XII Tab. 12.5 *...ut quodcumque postremum populus iussisset id ius ratumque esset;* or similarly, in the preliminary of the Pontifex Maximus to the *ver sacrum* (Livy 22.10.1-2), *...iniussu populi voveri non posse. Rogatus in haec verba populus: "Velitis iubeatisne haec sic fieri?"*, and also at the end of the formula itself (22.10.6): *"Si antidea senatus populusque iusserit fieri ac faxitur, eo populus solutus liber esto"*.[23]

---

[22] Magdelain "iūs" 319: "Le mot *ius* lui-même appartient étymologiquement au plus ancien lexique religieux, comme cela se manifeste en particulier dans le verbe *iurare* et dans le mot *ius iurandum*".

[23] Cf. also, in the *ver sacrum* formula, *ne populo scelus esto* (22.10.5), and my remarks ("Notes" 231) on *neque scelus esto/ne fraus esto* in the *ver sacrum* formula (and in similar collocations in other legal contexts) in connection with A3 **]os:fra[**). (The identification of **fra[** with *frau*s/*fraud-*, if it could be proven, would also be of interest for the etymology of the form: note Szemerényi's recent attempt to derive *frau*s from the **dhreugh-* of OHG *triogan* 'trügen' etc. [*Quellen* 33ff., similarly Schrijver *Laryngeals* 444], which nevertheless, in Szemerényi's analysis, rests on the claim that *fraus* shows a hypercorrect vocalism for expected **frōs* or **frūs*. Despite Szemerényi (op. cit. 34 n. 35), the latter is not likely to be directly attested in **sed.frude** (CIL 583.64 [Lex Repetund.]), even if this is not an error (cf. 583.69 **sed.fraude** and **fraud-** elsewhere in 583 passim), but an

2.5.d There is in addition a purely epigraphic argument in favor of **poplo[** (vs. **popli[**). As is particularly clear in Morandi's Fig. 3, there is an odd space after the **l** and before the break.[24] This is what led Prosdocimi to consider that **popl** could be an abbreviation, a hypothesis to be entertained with the utmost reserve (cf. **2.1.c** above). Even if (as seems possible) A1 was at this point beginning to curve upwards in preparation for rounding the approaching corner (cf. the discussion of B + C in **2.3.b** above), the lower part of a "long" character like I might still be expected to appear, at least vestigially, in the space visible before the break. It would be easier to imagine, however, that a small O — slightly raised with respect to the preceding **l**, because of the incipient curvature — might fit precisely on the edge of the break (or slightly into it), with no actual trace remaining.

2.5.e By way of conclusion, it may be convenient to provide a "composite" transcription of all three fragments, incorporating (i) those improved readings due to Morandi that seem likely to be correct, (ii) the new readings and restorations suggested above, and (iii) my tentative judgments about the number of missing characters between B2 + C2 and B3 + C3:

attestation of the *frūd-* weakly attested elsewhere (e.g. Lucr. 2.187, 6.187): the form can simply be decompositional, cf. (Plt., Ter.) *dēfrūdō* and *frūdō*. (A better candidate for an old **frūd-* might be *frustra*, if the quantity of the *-u-* were certain, and if its relationship with *fraus* — and the history of its formation — were clear.) It may thus be preferable, with Schrijver, to set up a **dhrou̯-Vd(h)-*, which could account for the *a*-vocalism regularly via "Thurneysen-Havet's law" (on which see now Schrijver op. cit. 436ff.).

[24] Cf. Prosdocimi "Studi 1979" 202: "Dopo *l* c'è uno spazio libero, ma l'incisione è molto disuguale per la distanza tra le lettere (cfr. B1 e C1)"; the latter point, however, is not directly applicable to A, as discussed in **2.3.b** and **2.5.a** above.

	A	B C
1.	**]i:poplo̱[**	**]x:iouo[sd]i̱case:(?)[**
2.	**]n:iouosd̨[ica-**	**]m̨od:ora̱t̨[(-)--]os:xxu̱li[**[25]
3.	**]os:fra[**	**]m:muliar[(-)-----]d:axxe̱m̨[**[26]
4.	**]os:us̱q[**	**]iou̱e[s]aioue[sa]tod**

[25] E.g. (gen. sg.) **ora̱t̨[or]os, ora̱t̨[ion]os**. The beginning of the next word is exceedingly unclear (very little can be discerned from the photographs); Morandi ("Ara" 109) takes the traces to reflect **h̨xu̱li[**, with "*het* chiuso", while Prosdocimi ("Studi 1979" 205f.) argues for **m̨u̱li[** (cf. B3 **muliar[**). In accord with the latter, note that the broad M otherwise clearly occupies nearly two letter spaces (as discussed in **2.3.b** above for the M of B3 **muliar[**, vis-à-vis B2), as it would need to do here.

[26] E.g. **muliar[:exesto]d**, cf. "Notes" 230. As with C3, the broken area renders the remainder extremely problematic, and I here simply print Morandi's transcription (cf. "Ara" 109); Prosdocimi ("Studi 1979" 211) reads **a[-]i̱o[** (with inverted L, cf. **3.1.c** below), e.g. **a[f/b]i̱o[ucod]** (cf. "Notes" 230 n. 36).

CHAPTER THREE

Inscriptions from Latium

3.1 *Notes on the Tibur Pedestal Inscription (CIL 2658)*
3.2 *"Itacismus" and Related Problems in CIL 610 and 37*
3.3 *CIL 34*
3.4 *Marginalia to CIL 549 Losna (I): On *-sN- Clusters in Latin and Italic*
3.5 *Marginalia to CIL 549 Losna (II): Lat. mōnstrum, lūstrum and Secondary Instrument-Noun Formations*
3.6 *Marginalia to CIL 549 Losna (III): Etruscan tusna*

3.1 *Notes on the Tibur Pedestal Inscription (CIL 2658)*

3.1.a The "Latinity" (as opposed to "Sabinity") of the language of the Tibur Pedestal Inscription CIL 2658,[1] datable to about 500 B.C. or slightly earlier, can no longer seriously be doubted,[2] thanks to Wachter's convincing confirmation of Radke's reading of the last three words (now to be read as **d[o]nom()pro()fileod**, see Wachter *Altlat. Inschr.* §31g).[3] Nevertheless, there is a considerable "non-urban" element to this inscription that continues to elude definitive interpretation, of which the most widely-discussed feature is the apparent three-term naming expression **Kauioș()[--]monios()Qetios** directly preceding the last three words.[4] The unusual serpentine format of this inscription, discovered by Vetter, has

---

[1] Pp. 738 (with photograph), 858; Wachter *Altlat. Inschr.* §§31-2, Degrassi *ILLRP* 5 (*Imagines* 118), Pisani *Lingue* 59, Ve 512, Agostiniani *Iscriz. parlanti* 596 bis; note also the detailed study by A. Mancini, *SE* 47 (1979) 370ff. (facsimile p. 372, photos Tavv. 72-4), hereafter cited as "Nuova lettura".

[2] See A. Keaney, *Glotta* 69 (1991) 203 n. 9, Coleman "Central Ital." 115.

[3] The Latinity of the inscription had already been defended by Ernout, *RPh* 33 (1959) 52ff.

[4] On this problem see Prosdocimi "Studi 1980" 240f., A. Marinetti *SE* 49 (1981) 353ff., Blümel "rez. Radke" 54. For the problem of the Q-like (or phi-like) character of **Qetios** (or **Φetios**, or **Sφetios**) see in addition Mancini "Nuova lettura" 373 (with n. 2), Wachter *Altlat. Inschr.* §31f, and Eichner "Reklameiamben" 222 n. 29 (**Qetios** = *Cottius*), as well as A. Maggiani, *SE* 55 (1987/1988) 195ff. on the somewhat similar problems surrounding alternants φ/θ in Etruscan. (The continued discussion in CIL p. 858 of the obsolete reading **capil[l]or** [cf. Comparetti ad CIL p. 738] for lines 1-2 is incomprehensible.)

attracted rather less attention (beyond its utility in interpreting the text), but is quite unlike any other archaic Latin inscription in a number of respects. I therefore offer several observations related both directly and indirectly to the use of serpentine technique in this document (**3.1.b-d**), and conclude with some comments on the interpretation of the first word **hoi** (**3.1.e-i**).

3.1.b The centripetal "Kantige Spiralschrift" format of the Tibur inscription[5] can be compared with the otherwise almost identical centrifugal patterning of the South Picene inscription TE 2. True spiral design, however, is not common in the South Picene material, and Marinetti (*Iscrizioni* 58) suggests that ornamental, aesthetic, or practical considerations may have helped to determine the graphic disposition of TE 2, as also other texts. But despite Marinetti's inclination to regard the facts of direction and letter orientation in the South Picene inscriptions as essentially unique, they do show obvious similarities to various boustrophedon, serpentine, and (especially) "Schlangenschrift" formats, including that of the Tibur inscription. Thus Wallace may be justified in suggesting that the serpentine style of this inscription reflects "a practice probably appropriated from the writing systems of the Sabines and South Picentes" ("Alphabet" 128). The further implications of this idea in terms of letter forms will be pursued in **3.1.d** below.

There is, however, a striking serpentine-related feature of the Tibur inscription that has not, to my knowledge, been noted before, namely a remarkably consistent "pivotal" use of the character "O". Being formally multivalent in terms of its orientation, this character naturally lends itself to marking (or facilitating) changes of direction, although ornamental considerations may also be involved. Apart from the high degree of consistency of this usage (four of the six corner characters are O), the use of a pivotal O in the transition from line 3 to line 4, where ample space was available below for extending line 3, suggests that this feature may not be due to chance.

If this pivotal technique is partly motivated by aesthetic considerations, it might simply reflect an idiosyncratic feature of this

[5] For the terminology, see Zinn "Schlangenschrift" 303 (Abb. 5), 319 (Abb. 10).

inscription. There are, however, suggestive parallels in some Venetic inscriptions both with simple boustrophedon and "Kantenschrift" design (see Zinn op. cit. 302, Abb. 4), as well as with formats very similar to the "Kantige Spiralschrift" of the Tibur inscription. Leaving aside the exclusively alphabetic tablets, which pose a number of special problems (see e.g. Prosdocimi, in *Veneti* 262ff.), possible examples of "pivotal" O's may appear in the following inscriptions:[6]

20 *[ ] / tina doto / re.i.tia.i.*
223.3-4 / *[---t]a.i.kve .e.kvo/petar.s.*

with *-o* at word- or compound-boundary, but also

9 ... *mo.l.donke/.o.* ...
13 *]oiiia/ko/.s.*
130 ... *rako/.i.* ...[7]

and perhaps most strikingly in the bronze alphabetic tablet *MLV* 8 (= *LV* Es 23)

mego()dona.s.to().e.b.()vhaba.i.tśa()p	[bottom horizontal]
ora.i.().o.p()io	[ascending vertical]
robo.s.	[descending vertical]

i.e. *p/ora.i.* and *io/robo.s* (according to the conventional interpretation of the word-division).[8] Naturally, such a listing (out of the hundreds of surviving Venetic texts) cannot be taken as proof, since a certain number of instances are likely to arise by chance, and since some of the Venetic formats do not in any case correspond precisely with that of the Tibur pedestal. But the possibility nonetheless deserves to be raised that this feature of the Tibur pedestal inscription may be intentional.

---

[6] Numeration and transcriptions after *MLV*, q.v. for precise information about the formats.
[7] Vs. 131.1-2 ... *ve.i.gno.i. / kara.n.mniio.i./*, 135.1-2 *vhugiio.i. u./posediio.i./*.
[8] See, however, A. Marinetti (*SE* 51 [1985] 293f.) for alternative readings of the sequence at the end of the first line.

3.1.c The inverted V (of **kauioş**) and the inverted L (of **fileod**) are generally assumed to be a consequence of the serpentine format, as noted, for example, by Mancini: "*u* ha il vertice in alto ... come *l* ..., solidarietà altrove sistematica (per esempio nel venetico) ma qui del tutto eccezionale, e pertanto da attribuire, piuttosto che a sistematicità, a incertezza da andamento bustrofedico e spiraliforme" ("Nuova lettura" 371; similarly Wachter *Altlat. Inschr.* §31b, with detailed discussion of the stonecutter's difficulties of orientation). It is worth noting, however, that inverted V and L are both attested in Latin contexts apparently lacking boustrophedon or serpentine influences. For inverted V, a certain example appears in the V of **Varia**, in the Latin part of the archaic Umbrian-Latin bilingual CIL 2873,[9] vs. **Varea** (with normal V) in the Umbrian part.

Several other cases are less certain. A possible example may appear in the archaic vase-inscription CIL 2903e (found in Sardinia, but of a Heraklesschale-type thought to be from Latium); the CIL facsimile (p. 895) is reproduced below:

Degrassi interprets as **M.Peio**; but as Krummrey points out (CIL ad loc.), a gentilicium *Peius* is otherwise unknown. Krummrey's suggestion **M.Teio(s)** solves this difficulty, but another solution (yielding, like **Teio(s)**, a known gentilicium) might be **M.Veio(s)**, with inverted V.[10]

The archaic inscription from Tor Tignosa CIL 2843 (late 4th/early 3rd c.) is now read by Guarducci as **Lare Aenia | d(ono)**. Despite the immense "Aeneas-cult" literature to which this inscription has contributed (see CIL pp. 864f.), a diphthongal sequence **Ae-** for this period is highly surprising, to say the least, whence the skepticism properly expressed by

[9] P. 878 (with facsimile), 3rd/2nd c.; Degrassi *ILLRP* 1206, Pocc 9, R 5 in Meiser *Lautgesch.* 4

[10] The short right stroke of the V, under this interpretation, might appear to be problematic, but note the short left stroke of the cursive E, and the small open O, raised to the level of the top of both the V (or T) and the E.

Wachter (*Altlat. Inschr.* n. 855): "... die Neulesung ... von M. Guarducci ... ist mir unverständlich und mit ihrem *ae* ohnehin zweifelhaft". It is especially to be noted from the photographs (e.g. Degrassi *Imagines* 3) that the A of **Lare** and the final A of the alleged **Aenia** both have clear (open ascending) cross-strokes, while no such mark is visible between the two first strokes of the second word.[11] For this reason, even Degrassi's **Aineia** (*ILLRP* 1271, thus also e.g. Leumann *LLuF* 7) is not entirely free from suspicion. In theory, then, this character can be (and has been) read as inverted V: cf. Kolbe's **Vesuia** (preferred, for example, by Radke, *Arch. Lat.* 214 n. 33), although still other interpretations with **V-** may be possible (e.g. **Venia**).[12]

Finally, for inverted V, consider the problematic ɳ of CIL 474 **eqo()Kaɳaios** (Ardea, mid-6th c.): the photographs and facsimiles[13] show that the right stroke of the alleged N is quite visibly separated from the other two strokes, and extends below them ("*N* con il terzo tratto disarticolato e lungo"; Colonna, *Lap. Sat.* loc. cit.). Even taking into account the severe curvature of the inscription, this stroke looks rather more like the following I than part of an N; if so, this would in theory allow for **Kaɳ-** (with inverted V), whence presumably Wachter's suggestion **Cavidios** (*Altlat. Inschr.* §36a), although his discussion does not make this clear.

As for inverted L, there is a striking comparandum to be noted from a fifth-century vase inscription with two L's, both of which are inverted, namely CIL 2917c **Palps Blaisios** (p. 901, with facsimile), see esp. Colonna in *Lap. Sat.* 67f. (photo Plate 18.4). Briquel, reading **Palpis**, took this to be Sabine ("Écriture" 831ff.), whereas Colonna's somewhat more complex account depends on the apparently Latin form of the ending of **Blaisios** ("L'iscrizione sembra dovuta ad un sabino, che latinizza correttamente il proprio gentilizio, conservando un prenome di forma italica"). A. Marinetti, however, has argued (*SE* 50 [1982] 364ff.) that the next-to-last letter is rather a (closed) H (of Archaic Faliscan type) to be

[11] The three other early Tor Tignosa inscriptions (CIL 2844-6, Degrassi *Imagines* 4-6), although engraved in a different hand (or hands), likewise all show open A's with clear ascending cross-strokes.

[12] See M. Morani, *Aevum* 57 (1983) 44ff. on the religious background of Lat. *venia*.

[13] CIL p. 421 (facsimile), further *Lap. Sat.* 66 (facsimile), with full bibliography (photograph Plate 18.3).

read with "South Picene" value, whence rather **Blaisiís** (for the ending, cf. **8.7.b-c** below). It should be noted, finally, that her further (more tentative) Neulesung for **Palps** operates with the possibility of inverted V instead of inverted L (thus perhaps **Pauq-**, cf. Mars. *Pacuies* etc.).

3.1.d As a final paleographical note, it is worth pointing out that correspondences with Venetic and especially South Picene writing go beyond the general facts of the serpentine layout and (if this is their correct explanation) the associated inverted V and L, as has in fact been hinted at by Briquel ("Écriture" 844 n. 3) and Colonna (*Lap. Sat.* 47 with n. 33).[14] The following relatively marked comparisons with South Picene can be noted, apart from inverted V and L:

(i) O in the form of a dot;[15]
(ii) closed H;[16]
(iii) three-stroke (angled) S and four-stroke (angled) S;[17]
(iv) K with separated diagonals[18]

to which may perhaps be added the similarity between the possible Q-sign of the Tibur inscription (cf. n. 4 above) and the Q-letter of MC 1. Although most of these features can be paralleled in other early texts,[19] it is the cumulative force of these co-occurrences that may be of significance, together with features more directly evocative of South Picene technique (O in the form of a dot, inverted V and L, serpentine style). There are, in addition, a number of other less marked parallels, such as the very similar

---

[14] Compare also Marinetti's observations in the context of **Blaisiís** (op. cit., esp. 368f.) on Sabine/South Picene alphabetic contacts.

[15] For these comparisons with South Picene see Marinetti's (slightly simplified) table of letter forms (*Iscrizioni* 60), and especially the photographs and facsimiles of the inscriptions.

[16] In South Picene without cross-stroke for /h/, but see Marinetti *Iscrizioni* 50ff. for (recumbent) closed H with cross-stroke among the *í* signs, presumably from upright closed H; further I. Adiego, *AION* 12 (1990) 257ff. for the special problem with the closed H sign in CH2.

[17] I.e. the two normal variants in South Picene, although apparently not found in the same inscription.

[18] One of the normal variants, see esp. TE 2, CH 2, RI 1.

[19] Thus both closed H and K with separated diagonals also in the Forum Inscription, etc.

E's, the similar tail-less form of R, and the similar four-stroke M's.[20] Indeed, the lettering of some of the South Picene inscriptions (perhaps AQ 2 most of all, on the famous "Guerriero di Capestrano") looks strikingly similar to that of the Tibur pedestal inscription, although the precise interpretation of these facts remains unclear.[21]

3.1.e Despite some occasional doubt,[22] it seems fairly clear that the inscription begins with the sequence **hoimedmitat**, which has naturally been interpreted as the three words **hoi()med()mitat**.[23] The interpretive possibilities for **hoi** are very limited: barring an unknown theonym, such a word would appear to be a form of the deictic pronoun seen in Lat. *hic/haec/hoc,* but without the enclitic particle *-c(e)*.[24] The precise analysis of **hoi**, however, is less clear. Two interpretations have been proposed: (i) traditionally, it has been taken as a locative, equivalent semantically (if not also morphologically) to Lat. *hīc;*[25] (ii) recently, however, Wachter has tentatively suggested (*Altlat. Inschr.* §32) that it is a dative not only with the meaning, but also essentially the same form (minus the particle *-c(e)*) of Lat. *huic,* thus "Ihm (dem Gott, 'ipsi') gibt (?) mich Gavios ... ". I consider first Wachter's dative interpretation.

3.1.f Wachter wonders whether a dative **hoi** = */hōi/* is possible, "auch wenn dieser später möglicherweise zweisilbig */huï-c/* ausgesprochen

---

[20] According to Colonna (*Lap. Sat.* 48), "nella base di Tivoli si incontra costantemente la *M* a cinque tratti"; but both four-stroke and five-stroke forms occur, see Mancini "Nuova lettura" 371.

[21] See Marinetti's discussion (*Iscrizioni* 239f.) of certain features pointing to the archaism of AQ 2, most of them shared with the Tibur inscription: "*a* con tratto obliquo, *e* a tratti obliqui, con il tratto verticale che prosegue, ... *k* con i tratti obliqui separati. ... l'assenza di interpunzione; ... scriptio continua" (for the last-named feature, otherwise only TE 4).

[22] E.g. C. de Simone, *GIF* 12 (1981) 31 n. 34.

[23] On **mitat** see also Mancini, *SE* 49 (1981) 365ff. Note further SPi. *]mitah* (AQ 1), cf. Meiser "Pälignisch" 119ff. on SPi. *-h* < **-d.* (Other ways of interpreting the initial sequence without assuming that **med** is the familiar acc. sg. of the first person pronoun [e.g. **hoimed** as an instrumental adverb of the type CIL 365 **rected**] seem to lead nowhere.)

[24] It is theoretically possible (but highly improbable) that the form shows an early Auslautschwund (for **hoic**) comparable to much later examples, cf. **hui** (CIL IX 5813) and similar forms (Sommer-Pfister *Hdbch.* 219).

[25] E.g. Prosdocimi, *SE* 47 (1979) 189, Mancini "Nuova lettura" 374, cf. Blümel "rez. Radke" 53; somewhat differently Eichner "Reklameiamben" 224 n. 34 §d, comparing *hūc.*

wurde"; he then (n. 212) observes that disyllabic scansion is apparently assured only at Plt. *Amph.* 702, citing Leumann *LLuF* 478. According to this conception, then, such disyllabic scansion as is attested (which he takes to be virtually nil) cannot be archaic, if **hoi** is to be taken as the ancestor of *hui(-c)*.

But the situation with disyllabic scansion of *huic* in Plautus is quite otherwise, as demonstrated convincingly by Lindsay, *ELV* 174ff. After a review of the evidence, Lindsay concludes (p. 176) that although *huīc* (metrically *hŭīc*) is indeed "rare, almost to the vanishing point", both it and its parallel relative form *quoiī* are securely attested, and "belong to legal, old-fashioned, precise speech". The instance at *Rud.* 1342f. (ia. sen.), one of those cited by Lindsay as particularly clear, is significant in this respect, in view of its repeated oath formula:

> GRIPUS. *tum ego huic Gripo, inquito et me tangito —*
> LABRAX. *tum ego huic Gripo (dico, Venus, ut tu audias)*[26]

Note further Lindsay's observations (p. 168) on the use of dat. *eī* (= "*ēī*") and *huīc* in prologues (e.g. *Rud.* 39 [ia. sen.] *huic filiola virgo periit parvola*), which "proclaims them as the correct, unslurred forms, the forms of deliberate utterance", and the possibly emphatic use at *Bacch.* 484 ([troch. sept.] *mihi discipulus, tibi sodalis periit, huic filius*).[27] It is exceedingly difficult, then, to dismiss this Plautine scansion (already obsolete for Terence) as an innovation without linguistic significance, as Wachter seems to do. A monosyllabic **hōi*, then, cannot be taken to underlie *hui-c*.[28]

---

[26] See Panhuis *Perspective* 99ff. for an analysis of the various stylistic levels of this entire passage, especially his characterization of lines 1338-44 as the "religious" portion, containing reflections of real votive texts, as opposed to other "colloquial" parts of the conversation.

[27] Another clear instance, to my mind, appears at *Bacch.* 764 ([ia. sen.] *nam non conducit huic sycophantiae*). None of the instances just adduced is noted by Leumann, who cites, apart from *Amph.* 702, only the uncertain cases *Pseud.* 775 and *Rud.* 750.

[28] The grammatical evidence Wachter cites (n. 212, cf. also n. 746) for an archaic *hoic* (VI.11.14ff. K [Mar. Victorin.], *pro huic hoic;* cf. **hoice** CIL 582.26 (Lex Bant.) and **hoic** CIL 590.30 (Lex Tarent.) and 2924.25 (Fragm. Tarent.), in archaizing legal contexts), even if accurate, does not prove that such a form was always monosyllabic, as opposed to a transitional /hoĭĭ(c)/ or the like, for earlier **hoiiei(ke)*.

3.1.g In theory, **hoi** could still be taken as a dative; but it would need to have a different formation from that which led to *huï-c*, perhaps as an earlier variant (maintained dialectally?), later ousted by a disyllabic form. The presumed original pronominal dat. sg. **ghosmōi* (cf. **3.1.i** below on nom. sg. **gho* vs. **ghi* etc.) > pre-Lat. **hosmōi* (cf. Skt. *tásmai, yásmai, asmái;* Umbr. *esmei,* **pusme**, SPi. *posmúi,* etc.) is nowhere attested in Latin, and might have been replaced, in the first instance, by an ordinary thematic (*o*-stem) dat. sg. **hōi,* in the manner of Gk. τῶι, and this early dative might still be directly attested in **hoi.** (Such a replacement would have been favored by the correspondence between pronominal gen. sg. **(g)hosio* and the probable existence, in (at least early stages of) Latino-Faliscan, of the thematic gen. sg. in **-osio.**) Later, such a form (or forms: one might also predict a f. **hāi*) must have been reshaped yet again, if we are to account for Arch. Lat. *hūīc*. This second reshaping essentially involves, descriptively speaking, the addition of the consonant-stem dat. sg. desinence **-ei* (thus roughly **hōi* > **hōi-ei*), a process that must somehow be assumed anyway for the gen. sg. as well (roughly **hosio* > **hosio-s*), in both demonstrative and relative-interrogative forms.[29]

3.1.h Wachter rejects the locative interpretation of **hoi**, on the grounds that Lat. *hei-ce* (> *hīc*) and Fal. *he(c)/fe* are not likely to derive from a preform **hoi-ke;*[30] but again, **hoi** need not be assumed to be the direct ancestor of Lat. *hei-ce.* In principle, an original loc. **hosmin* or the like (cf. SPi. *esmín,* Umbr. *esme* 'in hoc' VIb 55) could have been replaced in various ways; even if (as seems more likely) the locative of *o*-stems goes back to **-e-i* (and not **-o-i*),[31] a synchronic pronominal stem **ho-* (cf. acc.

---

[29] Without entering too deeply into the complex problems posed by these pronominal developments, it is perhaps easiest to assume that the process began with the genitive, where **ghosios* or **kʷosios* might yield (according to one view) **hoiios* and **kʷoiios* regularly, these stems then serving as the basis for dat. **hoii-ei/*kʷoii-ei*. A "pivotal" status for gen. *cuius* is also assumed by the "génitif-adjectif" approach (comparing Gk. ποῖος), still promulgated by F. Bader (e.g. *HS* 101 [1988] 177 n. 22, 191, *BSL* 86 [1991] 111f. with n. 45, and in *Laryngales* 6 n. 24); but the presumed **kʷoi-io-* is in my view morphologically difficult, and there is no trace of *o*-stem inflection for *cuius* (cf. Leumann *LLuF* 477).

[30] Wachter cites also a Fal. *heic,* presumably from Ve 322i (Giac. 121(IX)) = CIL 1989; but this is more likely to be a Latin (or Latin-influenced) form (cf. Vetter p. 313, Giacomelli *Lingua fal.* p. 150).

[31] Thus e.g. Leumann *LLuF* 412, 426.

hom*, abl. **hōd* etc.) might well have replaced a **hosm-* form in the first instance with a diphthongal **hoi*, which might still be attested in **hoi (cf. Eichner, n. 25 above). Especially if there existed a dat. **hōi* at about the same time (cf. **3.1.g** above), not to mention nom. pl. **hoi* (cf. also **3.1.i** on the possible existence of a nom. sg. m. **ho-ī*), the loc. **hoi* (> *hū-c*) could then have been remodeled to **hei(-ke)*, after noun-declension locatives (**dom-ei* etc.).[32]

3.1.i For the sake of completeness, there is a further theoretical possibility to be mentioned, namely that **hoi** is simply a nom. sg. m. **hoi* < **ho-ī*, i.e. **ho* with the addition of the deictic particle "*-ī*", functionally similar to **ho-ke;* cf. Gk. οὑτοσί, τοῖ, Lat. *utei* (if from **uta-ī*), and especially nom. sg. m. *quī* (CIL 4 **qoi**, cf. Osc. **pui**, Umbr. *poi*) < **kʷo-ī*, and perhaps even f./n. *haec* if from **hā-ī-ke*, cf. *quae*.[33] This would yield a conceivable interpretation of the sort: "Hĭc me [dedicat vel sim.] — (hĭc: viz.) Gavios [ ]monios Qetios — (me: viz.) donum pro filio".

This raises, however, the problem of the origin of Lat. nom. sg. *hic*. The traditional view is based on the existence of a pronominal stem **gho-* (nom. sg. m. **gho*, cf. **so* in Skt. *sá* etc.), which is not, however, attested outside Italic.[34] Lat. nom. sg. m. *hic* is thus said to result from the phonologically regular *proclitic* treatment of **ho-k(e)ˊ* (see e.g. Leumann *LLuF* 468). But Schmidt (*Stammbildung* 62ff.) has persuasively argued against this view, and in favor of the idea[35] that the nom. sg. m. was an "*i*-stem" form **ghi*, subject to the spread of *o*-stem forms typical of such paradigms, as in Lat. *is/eum* etc. (**i-s* vs. **e̯jo-/*e̯jā-*). If this is so, then the nom. sg. **ho-ī* conjectured above (as a theoretical possibility) would have

---

[32] Ven. *eik* (*MLV* 242A = *LV*Ca 4), if it means 'hīc', would seem to support the antiquity of a **hei-ke;* but the meaning and interpretation of the form are too uncertain for it to be used in this way (see *MLV* ad loc. and p. 100, *LV* 273 s.v., and most recently Prosdocimi *Veneti* 308).

[33] On this deictic element "*-ī*", see G. Dunkel (following Osthoff), in *Laryngaltheorie* 112 (frozen instrumental **ih₁* of pronominal **e̯i-/i-*).

[34] Lat. *hōrnus* 'this year's', and perhaps also Umbr. **-(h)unt/-(h)ont** '-dem' < **-hom+*, despite the difficulty in explaining the final *-t*, on which see von Planta *Gramm.* 2.218f.; the analysis of Lat. *eccum* is uncertain, despite e.g. Ernout's **ecce-hum* (*Morph. hist.* 90).

[35] Favored, among others, already by Meillet (e.g. Meillet-Vendryes *Traité* 497) and Ernout (*Morph. hist.* 90), cf. Ernout-Meillet *Dict.* s.v.

nothing directly to do with Lat. *hic*, but would seem to reflect a kind of *o*-stem replacement of the *i*-stem nom. sg. seen in *hic*, perhaps analogical to f. **hā-ī*. A nom. sg. **ho-ī*, in any case, might well be precarious, if there existed (as suggested above) dat. sg. **hōi* and loc. sg. **hoi*, not to mention nom. pl. m. **hoi*.

3.2 *"Itacismus" and Related Problems in CIL 610 and 37*

3.2.a The pedestal inscription CIL 610,[36] a dedication by C. Aurelius (praetor urbanus in 202 B.C., consul in 200, cf. Porter *Aurelii* 51ff.), shows what Wachter aptly describes as "eigenartige Orthographie", with three instances of **-i-** for *-ē-/-ĕ-* in **Aurilius, didit,** and **isdim** (as against **iterum**):

C.Aurilius.C.f
praitor
iterum.didit[37]
isdim.consl[38]
probavit[39]

The **-i-** for *-ĕ-* in **(is)dim, did(it)** could in principle be taken as assimilatory; indeed, the second might also be compared with the regressive assimilation in initial open syllables of *cinis, similis, sinister* etc.

---

[36] Pp. 500, 918 (Rome, Nemus Dianae); Wachter *Altlat. Inschr.* §118d, Degrassi *ILLRP* 75, Palmer *Lat. lang.* 27, Warmington *Remains* 76; photo of a squeeze: CIL p. 500 and (somewhat clearer) CIL XIV 4268.

[37] The divider after **iterum** does not appear in CIL; but the trace of one seems visible in the photograph, cf. also Wachter's rendering (with divider), p. 287.

[38] CIL (followed by Palmer and Warmington) prints **eisdim**; but Wachter (as also Degrassi) rightly prefers **isdim** on the basis of the photograph. The unusual abbreviatory spelling **consl** (cf., for example, the nearly contemporaneous CIL 608 **consol** [211 B.C.]) is partly explained by the need to conserve space at line-end, where the unstressed vowel of the second syllable was naturally most susceptible to elision (cf. **14.4.d**).

[39] The early iteration notice is problematic, and casts some doubt on the date and/or identity of this Gaius Aurelius; cf. the similar problem in **16.3.b**, and the reference there (with n. 16) to Badian's and Brennan's discussions of both cases.

(from **cenis* etc.).[40] It is perhaps more likely, however, that such spellings are in essence artificial, related to the persistent fluctuation **<e>/<i>** (mostly for /ĭ/) attested as early as CIL 9 (Scip. elog., with both **hic/bec**, cf. further **5.1.b**, **14.4.g** below). It is interesting to note, moreover, that the spelling **ei** for /ĕ/ begins to be attested relatively early, i.e. at approximately the same time as **isdim/didit**, namely in CIL 614 (189 B.C.) **inpeirator** (later also for /ĭ/, CIL 583.54 [Lex Repetund.] **seine** etc., cf. Leumann *LLuF* 64). Wachter's paleographic analysis of **inpeirator** (*Altlat. Inschr.* §118f) suggests that the I was inserted later, as a kind of correction, to an original **inperator**. According to Wachter, this may be related to the concurrent orthographic uncertainties surrounding **<e>** vs. **<ei>**, cf. CIL 581 (SCdeBacch) **nequis/neiquis** etc (on which further **10.2.b-d** below). While this is possible, as a purely orthographic analogy, it would be phonetically more natural to associate a spelling like **inpeirator** not with long vowels and diphthongs but rather with short vowels. Given, then, forms like **didit**, it may be equally possible to take corrected **inpeirator** (which may, after all, have more than one aetiology) as a kind of "compromise" spelling designed to allow for the possibility of **inpirator** (here note also *i...i*, as in **isdim**, **didit**), somewhat like the compromise spelling **<aei>** for older **<ai>**/newer **<ae>** that begins to appear not much later (CIL 633 **Caeicilius**, 638 **conquaeisivei** etc., cf. Wachter *Altlat. Inschr.* §218c). **Aurilius** raises a somewhat different set of problems, reserved for discussion below (**3.2.d-h**), following some remarks concerning CIL 37 (**3.2.b-c**).

3.2.b The "itacismus" of CIL 610 is odd, to be sure, but perhaps (as already suggested with regard to **inpeirator**) not entirely isolated: it is reminiscent cf CIL 37,[41] which may be approximately contemporaneous with it, or perhaps slightly older (on the relative dating cf. **3.3.g** below):

---

[40] Leumann *LLuF* 101 (with references), Sommer-Pfister *Hdbch.* 94; see now also H. Parker, *Glotta* 66 (1988) 221ff. Most examples occur before *l* or nasals, but the process is also attested (if rarely) before voiced stop (e.g. *vigil*) and *h* (e.g. *nihil*), although other analyses have been proposed for such items; cf. further **3.2.e** on this rule.

[41] Pp. 383, 863, origin unknown (Ritschl *Prisc. Lat.* 2B); Wachter *Altlat. Inschr.* §212a (with error **Apolonos** for **Apolones**), Degrassi *ILLRP* 51 (*Imagines* 27), Ernout *Recueil* 26, Warmington *Remains* p. 70 (with error **Condetius** for **Condetios**).

M.Mindios.L.fi
P.Condetios.Va.fi
aidiles.vicesma.parti
Apolones.dederi

Here the **-i** of **parti** is traditionally taken as an archaism, whether the form is accusative (cf. CIL 560 **piscim**) or ablative (see now Wachter's discussion of the problem, *Altlat. Inschr.* §212a, and further **14.2.d** below); but the **-i** of the much-discussed **dederi** is peculiar. If the form is taken to be linguistically real, it is far easier to assume that the final vowel somehow reflects a variant of the expected *-ĕ*, perhaps via a "contrastive spelling" (cf. Wachter *Altlat. Inschr.* §110g, further **7.7.c** below on CIL 560 **cofeci**), rather than a *-ī* to be compared with the difficult final diphthong of CIL 2832a **steterai**. But there are two other factors that serve to complicate the evaluation of **dederi**, and which suggest that the form need not in fact be taken quite at face value.

3.2.c It may be significant, firstly, that each of the first three lines of the inscription ends with a sequence /(-)Ci/, i.e.:

1 ... **.fi**
2 ... **.fi**
3 ... **(par)ti**

which might thus have exerted some pressure on the concluding **(dede)ri** of line 4, whether or not this is viewed as an actual error, or as a license related (broadly speaking) to some sort of aesthetic considerations. According to this scenario, then, the consistent line-final (and artificial) "itacismus" (here also **aidil-** with **ai-**) is similar to that found in a less clearly localized form throughout the text of CIL 610 (there also **praitor**).

On the other hand, the explanation for the -I of **dederi** may be entirely different, and of a quite trivial sort. Recall that this is a bronze plaque, and that the nail-holes at each corner remain perfectly visible; thus the corners appear as:

oM.MINDIOS ... FIo

oAPOLONES ... DEDERIo

It is clear, moreover, that the layout of the inscription is partly governed (as one might expect) by the positioning of these holes, which has caused the first and fourth lines to be indented on both left and right, as follows:

oM.MINDIOS ... FIo
P.COND ... VA.FI
AIDILES ... PARTI[42]
oAPOLONES ... DEDERIo

Note further that the form of E used throughout is relatively broad, whether or not the middle horizontal is slightly shortened (as in **aidiles, vicesma, Apolones, dederi**) or equal in length to the upper and lower horizontals (as in **Condetios**); E begins, moreover, with a vertical stroke otherwise identical to I.[43] It is conceivable, then, that **DEDERI** reflects simply an unfinished version of **DEDERE**, with the horizontals omitted because of the dangerous proximity of the directly-following nail-hole (if it was prepared first), or in anticipation of the space needed for it. Alternatively, but along the same lines, the form was used as an acceptable variant of **dedere**, mainly because of considerations about the available space.

In any case, very little weight in the way of linguistic argumentation can be attached to this form with respect to the **steterai** of the Lapis Satricanus (see, for example, the recent and somewhat involved discussion by Prosdocimi and Marinetti, "Terza plurale" 106).

3.2.d As for CIL 610 **Aurilius**, one could simply claim that this is a kind of "hyperurban" reaction to the rustic *-ē-* of the type **vecos, Martses** etc., at a time when urban **ei** (also **e**, as often in *o*-stem nom. pl.,

[42] Cf. also **14.2.d** (n. 16) on the compressed lettering of this line.
[43] As is normal for this period, there is no serif work.

consonant-stem dat. sg.) was already beginning to be pronounced /ĭ/. But there is a certain phonetic interest attached to **Aurilius** that has never been noted, namely the fact that this form would correspond precisely with the spontaneous regressive vowel-height assimilation rule (*ē* > *ī* before *-i-* in the next syllable) assumed by the handbooks for a small number of forms: thus both Leumann (*LLuF* 54) and Sommer-Pfister (*Hdbch.* 86) cite (MSS, glosses) *dēlīniō* (vs. the usual *dēlēniō*), *suspīciō* (**-spēk-*, cf. *speciō*), *subtīlis* (cf. *tēla*).[44] But this "rule" is in fact quite controversial: J. Otrębski (*KZ* 66 [1939] 243ff.) had already attempted to eliminate *suspīciō* (on which see further **3.2.e** below), and more recently M. Nyman (*Arctos* 12 [1978] 81ff.) has rejected the supposed *dēlīniō*, plausibly taken rather to reflect the prevalent late Latin confusion of *ē* and *ĭ*.[45] Still more recently, Pisani (*Sprache* 26 [1980] 185f.) has attempted to eliminate the *ē* > *ī* rule altogether by rejecting the traditional etymologies of the words in question, and this view has now been seconded by Nyman (*Arctos* 15 [1981] 85ff.),[46] who argues specifically against interpreting *exīlis* via this rule. Nevertheless, in view of the interesting form **Aurilius** (never mentioned, so far as I have been able to determine, in this connection), as well as the possibility (likewise generally ignored) that Lat. *vīlis* may also be taken to reflect such a process, the case warrants at least a brief reexamination.

3.2.e Pisani's and Nyman's skepticism about original *ē*-vocalism is indeed justified for some of the forms in question. Thus for *convīcium* '(abusive) shout etc.',[47] mentioned by Leumann (*LLuF* 293) as a possible example, assuming a basis **u̯ēc-* beside **u̯ōc-/*u̯ŏc-* (*vōx* etc.): there is no support for an old *ē*-grade, nor is there any reason to suspect one, and other etymologies are available (see Nyman "*exīlis*" 89). For *suspīciō*, similarly, an old **spēk-* (beside the **spek-* of *speciō* etc.) is difficult to justify, although the explanation for the *-ī-* is not entirely clear (see Nyman "*exīlis*" 89ff. for extended discussion).

---

[44] These treatments are based on the fundamental analysis by Solmsen, *KZ* 34 (1897) 1ff., esp. 15ff. for *ē* in non-initial syllables.

[45] Although not mentioned by Nyman, the late *mantīle* (MSS, glosses) may have the same explanation (see e.g. Ernout-Meillet *Dict.* s.v. *mantēle*), as opposed to analogical influence after words like *monīle* etc. (Solmsen).

[46] "Deleting a Lautgesetz: Lat. *exīlis* and Related Issues", hereafter cited as "*exīlis*".

[47] See the useful discussion of this term by Austin *Cael.* ad 6.25, p. 52.

The situation with *subtīlis* is rather different. Nyman ("*exīlis*" 88) correctly, in my view, rejects Pisani's etymology (**sub-tig-sli-*, cf. Gk. στίζω, Skt. *téjati*, but Lat. *stinguō* with *st-*). Instead, Nyman prefers the traditional etymology (**sub-tēlis*, cf. *tēla*), but with **subtēl-is* (according to an old idea of Parodi, reported already by Solmsen op. cit. 16) having undergone a morphological reanalysis, whence **subt-īlis*, perhaps with influence from *exīlis*. This is certainly possible; but if the rule in question can be supported in some form, it may also be possible to retain a lautgesetzlich account of *subtīlis*.

Further, as suggested above, Lat. *vīlis* (although never, to my knowledge, discussed in this connection) could also be taken to have undergone such an assimilation process, since in my view the most attractive etymology (see Walde-Hofmann *LEW* s.v.) begins from a **u̯es-li-* (cf. *vēnum* < **u̯es-no-*), which would otherwise be expected to yield ***vēlis*. A somewhat different account has been proposed by C. Watkins (*HSCP* 77 [1973] 196f.), who compares the initial syllable of *vigil:* thus **u̯es-li-* might have developed to **u̯is-li-*, either via a vowel-assimilation of the type seen in *cinis, sinister* etc. (cf. **3.2.a** above on **didit**), according to the usual explanation of *vigil*, or (as Watkins prefers) via a sporadic dissimilation of *e* to *i* in initial syllables after labial, as perhaps seen in forms like *vitulus*, Umbr. *uitlu* (to **u̯et-* 'year'). Since, however, the "*vigil*" rule is an irregular process mainly restricted to position before *-l-* and nasals and not otherwise attested before *-s-*, and since the *vitulus* dissimilation is even more sporadic (or dialectal?), one can at least provisionally consider the possibility that **u̯es-* would here simply remain intact (cf. *vēnum*, not ***vīnum*, further *vestis, vesper* etc.), and that **u̯ēlis* > *vīlis* results from regular sound change, i.e. by the rule under consideration, if it can be further justified.

It is important to note, before proceeding, that under this assumption, *vīlis* would represent a unique case in which the alleged rule would appear to operate in an initial syllable, since Solmsen has shown (op. cit. 4ff.) that *ē* in initial syllables (preceding *i* in the following syllable) in general remains unchanged: thus *lēnis, sēmi-, bēstia, mētior, fēriae*, etc.[48]

[48] See Solmsen op. cit. 7ff. for *stīria* (which may have an inherited *-ī-*) and inscriptional *sīricus* (CIL XIV 2215.17 vestem.siricam etc.) vis-à-vis normal *sēricus*.

In principle, this fact about *vīlis* is either problematic, or else significant in terms of the rule's formulation.

The other traditional examples (*exīlis, fīlius*) can be left aside for the moment as being etymologically too ambiguous to be used as evidence, despite Nyman's concerted attempt to argue for the *īlia* analysis of *exīlis* (cf. Fr. *efflanqué* 'thin, lank, meager etc.').[49] Likewise of little value for this problem, in view of numerous formal and etymological uncertainties, is the comparison of *vēsīca* (also *vensīca, vessīca*) 'bladder' with *vīsīre* (also *vissīre, bīsīre, bissīre*) 'fart softly' (see J. André, *RPh* 58 [1984/5] 175ff.).

3.2.f If, then, both *suspīciō* and *convīcium* have been properly eliminated as examples of the *ē* > *ī* rule, we are left with the possible examples *subtīlis* and *vīlis;* and since *vīlis* (unlike *lēnis, sēmi-* etc., cf. above) shows the change in its initial syllable, it appears necessary to restrict the process precisely to *-ēli-* > *-īli-* (cf. also **Aurilius**, more on which below). Each of these forms, moreover, is isolated, with no synchronic connection to their derivational bases, which makes it more likely that the process *-ēli-* > *-īli-* (if it is real) results from regular sound change. Note further Nyman's two major theoretical objections to the traditional assimilation rule (see esp. "*exīlis*" 92ff.), namely (i) the indiscriminate use (in etymologizing *exīlis* in particular) of a formant **-sli-*, which Nyman claims has a morphologically dubious status,[50] and (ii) the alleged phonetic unnaturalness of such an "anticipatory distant assimilation", especially since the conditioning *-i-* is unstressed. As for (i): in these terms, both *subtīlis* and *vīlis* are entirely unobjectionable from a morphological standpoint.[51] What remains, then, is to provide a plausible phonetic justification for the process, and a consideration of what appear to be a number of counterexamples (*fidēlis, fēlīx,* etc.).

With the process now conceived as *-ēli-* > *-īli-*, the question of phonetic naturalness appears in a new light. In principle, the most natural

[49] For *fīlius* (here again *-ī-* in initial syllable): besides **dheh₁-l-*, also **dhih₁-l-* (with laryngeal metathesis) and **bhuH-l-* (thus Pisani).

[50] Similarly also, in this connection, Nyman's more recent remarks on *exīlis, Emerita* 58 (1990) 219.

[51] On the formation of *tēla* see Olsen *Instr. Noun* 16, following L. Joseph, *Ériu* 33 (1982) 43.

way to explain such a development would be in terms of an *i*-epenthesis (or "*i*-infection") consequent on the palatalization of the intervening segment (as in Avestan, for example), i.e. *-ēli-* > *-ē^{i}l'i-* (cf. Av. *pairi* etc.); assuming chronology to be in order, this *-ē^{i}l'i-* might then fall together with **-eili-* and thus develop to Lat. *-ɪl(')i-*. That the "epenthesis" or "infection" part of the analysis is phonetically natural for Latin can be supported on the basis of an orthographic feature Wachter has aptly referred to as "epenthetic spelling", especially visible in several early and relatively clear-cut Praenestine examples (see *Altlat. Inschr.* §§59b, 110b, 113). In such cases, a long vowel is spelled with an adventitious following *-i-*, before an *-i-* in the next syllable (including *-i-* resulting from vowel-weakening): thus CIL 552 **Painiscos** for /Pā^{i}niscos/, 569 **poimilionom** for /*pō^{i}miliōnom/, 62 **leigibus** for /le^{i}gibus/ (all early Praen.);[52] and for later Praenestine Latin also CIL 3072 **Trmeili** for /Tr(e)mē^{i}li/ (cf. Wachter §95t, citing SIG 688 Τρεμήλιος [135 B.C.]), with precisely the sequence under consideration. The process, however, is not restricted to Praeneste: note also the early Roman example CIL 518 **Iuilius** (for /Iū^{i}lius/, see Wachter §150j), and with /r/ note the newly-published **mairito** for /ma^{i}rītō/ (Spain; *AE* [1984] 545).

For *-l-* in particular, there is reason to believe (despite the difficulty in interpreting the grammarians' notoriously ambiguous descriptions) that bright *-l-* under some circumstances had a distinct palatal quality. Compare, for example, Cowgill's derivation of (2sg.) *vīs* (*Sprache* 24 [1978] 25ff.), where evidence for palatal quality of bright *-l-* is provided by the stage (**ɣ̯ell+s* >) **ɣ̯els* (presumably /*wel's/) > **ɣ̯eis*, on which see further the discussion by Parker, *Rel. Chronol.* Ch. 1.

3.2.g Given the backgrounds of both *subtīlis* and *vīlis*, one could further restrict the rule to original sequences **-esli-*, with the idea that the palatalizing effect was enhanced by the voiced apical *-z-* (after the voicing stage *-ezli-*), such that **-ez'l'i-* (now with a palatalized cluster) might more readily develop to **-ē^{i}l'i-*. In this event, the range of possible counterexamples would naturally be extremely limited; but even without

[52] See also Wachter *Altlat. Inschr.* §64d on CIL 567 **Creisita**; on **leigibus** also n. 16 at **5.3.d**.

this restriction, most surface instances of Lat. *-ēli-* can be explained secondarily, despite e.g. Schrijver *Laryngeals* 242.[53] Thus *fidēlis* is easily restored after *fidēs* (similarly *famēlicus* after *famēs*, the latter with old abl. *famē*), and *crūdēlis* (which, to be sure, poses many problems, susceptible of various solutions)[54] could be modeled on *fidēlis*. In a similar way, the link between *stēliō* (also *stelliō*) 'newt, gecko (with star-like markings)' and *stēlla* was no doubt clear; the same can also be argued for the connection between *fēlīx* and *fēmina, fētus, fēcundus*,[55] which would suggest in turn that *fīlius* is after all better explained via inherited **-ī-* or **-ū-* rather than **-ē-*.[56] A form like *contumēlia* is difficult to separate from the *-ēla* formation of *loquēla, querēla* etc. (thus e.g. Benveniste *Origines* 42), however this class is to be explained.[57] Adjectives of the type *patruēlis, carduēlis* can be explained on the basis of a relatively late dissimilation process *-uī-* > *-uē-* starting from expected **patruīlis* etc. (Leumann *LLuF* 54, 350, comparing the analogous process *-iī-* > *-iē-* of *aliēnus* for **aliīnus*). And several forms may be borrowed (e.g. *fēlēs* 'marten, ferret' [gen. sg. *fēlis*], *mēlēs* 'badger, marten' [gen. pl. *mēlium*], with *fēl-* easily restored after the nom. in any case) or have other special explanations: thus *mēlicae (gallinae)* may have a dialectal *-l-* for original *-d-*, if Varro's etymology is to be trusted (*"hae primo dicebantur, quae ex Medica ... erant allatae", R.R.* 3.9.19); the original inflectional behavior of *fēlēs* and *mēlēs* is actually unknown, since such forms could have been modeled on *volpēs* (Schrijver *Laryngeals* 375); etc.

As for the gentilicia *Cornēlius, Aurēlius:* an etymological tradition of sorts is available at least for the latter, according to which the name is said to be based on the Sabine (pre-rhotacism) solar theonym *Ausel* (e.g. P.F. 22.5 L, cf. Radke *Arch. Lat.* 48).[58] Thus *Aurēlio-/*Ausēlio-* could have its vocalism restored after the plain *o*-stem *Ausēl(o)-*. It seems

---

[53] "... the assumed rule **ē* > *ī* before *li* is ad hoc and contradicted by *fēlīx*".

[54] Perhaps for **cruēlis* (**kruues-*, cf. *cruor*), reshaped after *crūdus* (Szemerényi, *Glotta* 33 [1954] 280 n. 2).

[55] See on this point E. B. Holtsmark, *Eranos* 86 (1988) 71ff.

[56] For inherited **-ī-* see now Schrijver *Laryngeals* 242, 344.

[57] See now Melchert *Studies* 119f., with further references.

[58] On the Sabine background of the *gens Aurelia* see further Tibiletti-Bruno *Sabini* 33f., Porter *Aurelii* 4ff., and J. C. Richard, in *Mél. Heurg.* 915ff.; cf. also A. Keaney, *Glotta* 69 (1991) 202ff. on Sab. *Clausus* and the *gens Claudia.*

unlikely, however, that the **Aurilius** of CIL 610 is an archaism reflecting the phonologically regular *Aurīlius* otherwise completely ousted in favor of *Aurēlius;* it can, however, show a spontaneous application of the same process, further supported by the "hyper-urbanizing" and "itacizing" factors already mentioned.

3.2.h I add the following as a final gloss on *Aurēlius,* and specifically the morphology of the Sabine theonym *Ausel* assumed to underlie it. *Ausel* is said to derive from the *e*-grade of a normal proterokinetic *s*-stem **h₂éus-os* (wk. **h₂(e)us-és-*), beside the well-attested animate amphikinetic **h₂éus-ōs*/**h₂éus-ŏs-* (wk. **h₂us-s-´*) of Lat. *aurōra,* Hom. ἠώς, Ved. *uṣás-* etc. 'dawn': thus **h₂eus-es-(lo-) > *Ausē(los)* etc. (cf. Ernout *Phil.* 2.25, Radke *Arch. Lat.* 48f.). But the only other evidence supporting (however indirectly) such a proterokinetic *s*-stem **h₂éus-os* seems to be the "regressive" accentuation of Att. ἕως beside Hom. ἠώς (see e.g. Ernout *Phil.* 2.104). This accentuation, however, can equally well be explained secondarily,[59] i.e. as a generalization of the pattern of ἔωθεν, itself resulting regularly via "Vendryes' Law" (cf. Wackernagel *Kl. Schr.* 2.1151ff.). In the absence, then, of evidence for a proterokinetic *s*-stem, it seems preferable to begin directly from a formation based on the weak stem of**h₂éus-ōs,* e.g. an endingless loc. **h₂us-és* 'at dawn' (cf. RV *uṣási*), although the derivational details are difficult to ascertain (**h₂us-es-lo-* 'sun', with "endearing" **-lo-*?[60]).

These morphological observations have a potential phonological consequence. If a proterokinetic *s*-stem is not an attractive source for *Ausel,* there is less reason to derive the form from a full grade. This recalls the problem of the development of initial **h₂u-* in Latin, which has hinged until now on the analysis of *aurōra* itself: cf. Ringe's discussion (in *Laryngaltheorie* 432f. with n. 46), in which a zero-grade source for *aurōra* is explicitly entertained, thereby supporting a development **h₂u- > au-*.[61]

---

[59] Cf. Schwyzer *Gr. Gr.* 383 and Frisk s.v. ἕως, similarly Tronskij *Udarenie* 100, Lejeune *Phonét. hist.* 296 ("innovation").

[60] Cf. Leumann *LLuF* 310, and further Zucchelli *Studi* 57ff., 82ff. on **-lo-* and theonyms in Latin and elsewhere (without reference to *Ausel*/*Aurelius*).

[61] Similarly B. Forssman, *KZ* 96 (1982/3) 291 ("Kann nicht *ə₂u > au* auch z.B. fürs Lat. gelten?"), contra Peters *Untersuch.* 31; but more recently Schrijver *Laryngeals* 47, 74 contra **h₂uC- >* Lat. *auC-*, and in favor of a full-grade source for *aurōra.*

Thus for *Ausel/Aurēlius*, we can at least say that a previously favored morphological analysis implying an original full grade is unattractive, although it remains unclear whether the starting-point was a zero grade (perhaps the simplest assumption), or conceivably a secondary full grade, depending on the precise derivational interpretation of the **-lo-* formation.[62]

3.3 *CIL 34*

3.3.a The origin of the bronze plate bearing the inscription CIL 34[63] is unknown, but the object is generally thought to be from Rome. Taken together, the linguistic and paleographic features agreed to carry diagnostic value (**-os, Men-, -ai, -om**; open P, angled L; see below on inclined N) serve to support, in a general way, the widely-accepted third-/second-century dating. There are, however, several additional paleographical facts worth noting, both interesting in themselves, and perhaps also relevant for evaluating relative chronology.

3.3.b The inscription reads as follows (including spacing and indentation, more on which below):

Pl.Specios

Menervai
donom
port

The extra space between the first two lines, which seems to amount to nearly a full line, is not indicated in the CIL transcription, but appears clearly in Ritscbl's rendering. For the present, we can simply note that by this means, the name of the donor is separated or "set off" from the

---

[62] Cf. the similar ambiguity for *augēre*, which could also in theory reflect a secondary full grade, as Ringe notes (loc. cit.).

[63] Pp. 388, 862 (Ritschl *Prisc. Lat.* 2C, "ad aes"); Wachter *Altlat. Inschr.* §150a, Degrassi *ILLRP* 234, Warmington *Remains* p. 70.

theonym, a point to which we will return after considering the rather striking indentation of **donom** in line 3.

3.3.c In general, as with many of the other orthographic and paleographic features discussed elsewhere in Part I and in Part II below, epigraphical handbooks and other standard treatments provide very little information about the history of indentation and centering practices, and seem mainly to assign positive value judgments to compositions showing "symmetrical order" ("Mittelachsenordnung"), or other symmetrical designs. The manuals note that these become more and more frequent, with the implication that earlier asymmetrical styles simply reflect a lack of skill with (or attention to) this particular feature of epigraphic composition, which is taken to be essentially aesthetic in nature. It is sobering to realize that a carefully-executed example of "Mittelachsenordnung" is attested already around 500 B.C., according to Colonna's generally accepted analysis of the disposition of the two lines of the Lapis Satricanus (see *Lap. Sat.* 41f.).[64]

Thus, at least according to traditional conceptions, an irregular layout of the sort found here is certainly consistent with archaism, of itself not a terribly enlightening conclusion. But there may be more systematic observations to be made about the history of such techniques, which in turn might allow for more secure indications concerning chronology. Specifically, the indented third line of CIL 34 conforms to a pattern that is in fact typical of other third- and second-century inscriptions of similar type, in which the line following the theonym is indented, having the effect, presumably, of setting off or foregrounding the divinity. Note the similar layout, for example, in the votive inscription CIL 607, probably a late-third-century text (see Gordon's letter-descriptions, *Introduction* 6 ad loc., p. 82):

---

[64] Coleman's transcription at "Central Ital." 120 perverts both word-spacing (the text has scriptio continua, despite his oddly inconsistent notation) and line-division (mistakenly *ualesio/siosuodales* for *ualesiosio/suodales*); cf. **1.5.d** n. 36.

Hercolei
sacrom
M.Minuci.C.f
dictator.voy | it[65]

Naturally, the same traditional design appears in later compositions as well, where it may be considered a kind of "archaizing" feature; thus CIL 656 (probably mid-second century):

Fortuna[
sac[
T.Quincti[
senati.sente[

Compare also CIL 2111 (= Ve 235), from Fulginium, generally considered to be Umbrian (but written in Latin characters):

Supunne
sacr

See the well-reproduced photo in Peruzzi *Pesaro* (Tav. 10), and his discussion (163 ff.), with the observation that the disposition of this inscription is similar to that of the famous lost cippus CIL 975 **devas | corniscas | sacrum**, in which **sacrum** was likewise indented (to judge from our sources).

Somewhat differently — but again with a marked positioning of **sacr-** vis-à-vis the theonym — is the second-century altar inscription CIL 1581 (photograph in Degrassi *Imagines* 59), with the first three lines positioned vertically, reading from the top down, and with the fourth line (**sacra**) positioned horizontally at the base, somewhat as follows:[66]

---

[65] See **13.3** for this "in latere" format, and **13.3.e** for this instance.

[66] For typographical convenience, the sideways (i.e. downward-facing) orientation of the letters in lines 1-3 is not reproduced here.

T L I
u o u
s u n
c c o
o i n
l n e
a a
n
a

s a c r a

3.3.d The above observations provide a plausible interpretation for a hitherto puzzling and generally ignored feature of spacing in CIL 365 ("Faliscan-Latin", see further n. 69 below). Note the spacing in the following transcription (cf. the facsimile, CIL p. 404):

Menerva. sacru
[L]a.Cotena.La.f.pretod. de
zenatuo.sententiad.vootum
dedet. cuando.datu.rected
cuncaptum[67]

This text, then, makes use in lines 2 and 4 of a form of syntactic space punctuation not uncommon in Roman legal inscriptions (see in general Wingo *Punctuation* 70ff., 127ff.).[68] But the space in **Menerva. sacru**, which is approximately two characters larger than that between **pretod**

[67] The internal spacing is notated by Wachter (*Altlat. Inschr.* §205a, but with proportionally too wide a space between **dedet** and **cuando**), and also by Vetter (320), although in an overly subtle way that is easy to miss; it is otherwise generally ignored (e.g. Giac. 59, Pisani *Lingue* 154, Degrassi *ILLRP* 238, Ernout *Recueil* 63, Palmer *Lat. Lang.* 42, Warmington *Remains* p. 80).

[68] Wachter correctly observes (§205b) that the syntactic pause and the extra space after **pretod** constitute a valid argument (among several others he raises) against the usual view that the **-d** of **pretod** is to be explained as a sandhi-effect.

and **de**, is not of this type, but corresponds instead to a "linear" or horizontal version, as it were, of the vertical indentation patterns of the type just discussed.[69]

3.3.e Another early variant, which also bears comparison with CIL 34, involves indentation of the theonym (with part or all of the dedicatory formula) after a first-line donor-name, cf. CIL 34 with first-line donor name separated by spacing from the following theonym; thus CIL 30 (3rd/2nd c.):

M.C.Pomplio.No.
dedron f[70]
Hercole

and similarly CIL 2675a (3rd c.):

Turp.Orcio.P.f
Hercole.dono
dat.lubes.merto[71]

---

[69] Although this document is essentially Faliscan, "offensichtlich war das Faliskisch zur Abfassungszeit unserer Inschrift allgemein und speziell bezüglich der Amtssprache sehr stark latinisiert" (Wachter *Altlat. Inschr.* §205c). This form of legal space punctuation should thus be added to the list of such features. This, in turn, makes it all the more likely that **cuncaptum** here has its root vocalism restored (thus Pisani *Lingue* 154 ad loc.), cf. CIL 583.15 (Lex Repetund.) **exaestumaverit**. As Wachter notes (loc. cit.), there are no secure Faliscan cases that demonstrate unequivocally that Faliscan lacks medial vowel-weakening: see his discussions of (possibly Faliscan) CIL 454]**spater** (*Altlat. Inschr.* §166; vocalism probably restored, cf. Praen. **[D]iespater** 568, which post-dates vowel-weakening) and CIL 364 **aciptum** 'acceptum' (*Altlat. Inschr.* §204d,g; cf. frequent Arch. Lat. *ĕ/ĭ* confusions [**hic/hec** etc., cf. **3.2.a, 5.1.b, 14.4.g**], including 364 **Falesce** and aberrant [for this period] **Minervai** [cf. CIL 365 **Menerva**]). As for Arch. Fal. **pe:paraj** (which Wachter does not mention): this form may simply pre-date vowel-weakening (Giacomelli *Lingua fal.* 127, Pisani *Lingue* 151 ad loc.); thus the traditional dogma that Faliscan (as opposed to Latin) is characterized by lack of medial vowel-weakening (e.g. Leumann *LLuF* 84, Sommer-Pfister *Hdbch.* 74, 83, Vetter ad 339d, Tronskij *Očerki* 90, Giacomelli *Lingua fal.* pp. 68, 127f. [for **cuncaptum** and **aciptum**], Parker *Rel. Chronol.* Ch. 8 (§5)) rests on almost nothing.

[70] See **13.4** for this "overhanging" format.

[71] Here note that, among other errors (cf. **7.6.f**, n. 32), the CIL transcription (p. 832) mistakenly indicates that the third line begins almost two full characters to the left of the first line, thereby obscuring this symmetrical pattern (cf. Degrassi *Imagines* 65).

The order of the two elements can also be reversed, thus e.g. CIL 976:

Coronicei
T.Terentius.L.C.l.donom.
mereto.dedet

and the equivalence of these types can be demonstrated by the following "mirror-image" pair from the same set of (probably late-third-century) Feronia dedications, compare CIL 2869a:

M.T.V.Genucilio.Sen.L
Feroneai.dedit,

with 2868:

L.Calpurnius
[Fe]ronea.dono.merite[72]

3.3.f Still another method of foregrounding a theonym by indentation accounts for the *inscription-initial* blank space of some early votive inscriptions, as in CIL 609 (Ritschl *Prisc. Lat.* 50A, Degrassi *Imagines* 99):

Martei
[M.]Claudius.M̨[.f]
[c]onsol.ded[it]

and in the pedestal inscriptions CIL 28 (Degrassi *Imagines* 22A) and 33 (*Imagines* 110):

[72] Or perhaps **meritedț**, cf **7.7.g** below.

CIL 28
Aescolapio
donom-dat
lubens-merito
M̨-Populicio-M-f

CIL 33
[Nu]misio.Mar[tio]
M.Terebonio.C.l
donum.dat.libenş
meritod

The second of these examples is particularly interesting, since it shows a more elaborate left-indentation design, with little concern for the right margin: line 1 (theonym) is indented by one character with respect to line 2 (donor name), which is indented one character with respect to line 3 (**donum.dat.libenş**), and the final line (4 **meritod**) returns to the position of the initial line.

Note finally that the same pattern appears with **sacr-**, as might be expected, as in CIL 3171 from Calabria (Mesagne)[73]:

Diovei.Mourç[
sacr[74]

Cf. also the indented inscription-initial **Menerva** in CIL 365 (**3.3.d** above), followed by the linear "space-indented" **sacru.**

What is most interesting is that first, these patterns are evidently well-established by the late third century, and that second, the arrangement of CIL 34 shows clear correspondences to them, yet with an unusual (if not unique) design in terms of spacing. Together with the facts of letter forms

---

[73] P. 1024 (photo tab. 66 fig. 1); Wachter *Altlat. Inschr.* §197a, cf. also Ribezzo *CIM* p. 87 (with photograph).

[74] Wachter **Diovei()Mourc[**, but the word-divider is visible in the photograph. Torelli (*RAL* 24 [1969] 36ff.) identifies the epithet with *dea Murcia* etc. (see Radke *Götter* 224 s.v. *Murcia* for details), but the reading and interpretation do not strike me as certain: see Haas' alternative analysis based on his reading **Mourj[** (from autopsy), *Messap. Stud.* 15, and somewhat differently (via *Mourg-*) also Santoro, *NSM* 2.133ff., esp. 139f. with n. 20.

(see next section), the evidence presented above can thus be used to support the third-/second-century dating in a rather more concrete way than has hitherto been possible. Moreover, the fact that CIL 34 is not completely congruent with the patterns described above may suggest a dating at the earlier rather than the later end of the scale, i.e. slightly before these usages became fixed as described above.[75]

3.3.g The lettering style of CIL 34 is crude and irregular (cf. Ritschl *Prisc. Lat.*, col. 3 of his introduction: "litteris vulgaribus"), but clearly of an archaic type: there are striking paleographic correspondences, for example, with the more finished (but otherwise very similar) lettering of e.g. CIL 37 (Degrassi *Imagines* 27) and the Scipionic epitaphs CIL 8 and 9 (*Imagines* 133). Several specific points, including more detailed comparison with CIL 37, are worth considering more carefully.

In addition to the form of L and P, already mentioned (**3.3.a**), note also slanted M, and more importantly (from the point of view of relative chronology) the two N's, misleadingly printed as upright N in CIL, but with clear slant for the left stroke (somewhat more marked for **Menervai** than for **donom**). Of particular interest is the form of the R in **port** (Wachter **poṛt**, without explanation), which CIL, again misleadingly (despite the careful use of open P and angled L), prints simply as R. Although the character seems to have been slightly damaged (in view of the shaded area, particularly in the circular portion), it quite clearly lacks a tail, and therefore corresponds to the archaic P (= R) of the type found in the Forum Inscription and the Lapis Satricanus.[76] In contrast, the R of **Menervai** is the "modern" R, with full tail, reaching the bottom of the letter space.

It is particularly interesting to compare the lettering of CIL 34 with the more finished but markedly similar style of CIL 37; in addition to parallel orthographic features (34 **Specios** / 37 **Mindios, Condetios**; 34 **(Menerv)ai** / 37 **ai(diles)**), note the following paleographical correspondences, in themselves not surprising:

---

[75] For some "text-critical" applications of such facts about indentation patterns, see **4.5.c** and **7.6.f** (v).

[76] For another possible third-century example see **5.3.e**.

(i) (sharply) angled L
(ii) narrow C
(iii) slanted M
(iv) N nearly upright, with slight tilt to left stroke (cf. above for 34; thus 37 **Condetios, Apolones**, vs. **Mindios** upright)
(v) interpuncts at mid-point of letter-space
(vi) narrow S (37), cf. the irregular S's of 34 (narrow-top type)

To these can be added, however, the following more conspicuous facts concerning R:

(vii) CIL 34: "modern" R (**Menervai**) beside archaic tail-less R (**port**), as described above; cf. CIL 37: "modern" R (**parti**) — NB: in a word that also has P = **p** — beside archaic R with extremely short tail (**dederi**).

The most salient divergence in letter-forms, then, concerns P, i.e. open P (34, as for example in the Scipionic CIL 8 and 9) vs. closed P (37). Bearing in mind the fact that some of the features discussed here cannot of course be used as absolute dating criteria,[77] their cumulative evaluation, together with other features of design (as discussed above), can still be valuable. In conclusion, the above facts may suggest that the date of CIL 34 can be assigned with more confidence to the third century rather than the second.

3.3.h Despite the traditional urban attribution (here note the "standard" dative **-ai**), the opening praenomen provides an interesting complication. The unique abbreviation **Pl.** is generally interpreted as *Pl(autos)* (otherwise unknown as a praenomen) or conceivably *Pl(autios)*;[78] but both Wachter (n. 558) and Salomies (*Vornamen* 86) observe that a name corresponding to the Osc. praenomen *Plasis* (Ve 4.3) is equally (if not more) likely (thus here Lat. **Pl(asios)**), perhaps also attested in the

[77] See esp. Wachter *Altlat. Inschr.* §§152ff., e.g. 153c and 154a on squared vs. rounded open P.
[78] Thus CIL, Warmington, Degrassi (with query); further references at Salomies *Vornamen* 86 with n. 228.

Praenestine praenomen abbreviated **Pla.** (CIL 189, cipp. Praen. = Ve 433.2).[79]

3.3.i Perhaps not unrelated to the interpretation of **Pl.** is the problem posed by the final form **port.** Since there is ample space after the word, the form would appear to be an abbreviation for *port(at)* (thus CIL, Warmington, Degrassi with query, similarly already Orelli *Collectio* 1421 "portat?") or *port(avit)*.[80] But *portare* (as opposed to *dare, porricere, porrigere*, etc.) is lexically odd in this formula (cf. in general Euler *Dōnom*), as well expressed already by Dessau (*ILS* 3126 ad loc.: "Portandi vocabulum mirum in dedicatione").

Peruzzi ("Marsi" 177) has noted an interesting parallel in the archaic Lacus Fucinus bronze CIL 5, where the offering to Angitia appears with the unusual phrase ("hapax molto significativo") **donom.atoɟerę.**[81] Comparing such usages as *ex Arabia tibi attuli tus* (Plt. *Truc.* 539f.), Peruzzi asserts that the phraseology with *donum afferre* must mean that "il dono viene recato ad Angitia da fuori", and that the use of *donum portare* in CIL 34 must have the same sense. The use of *donum afferre* in CIL 5 may well be "molto significativo" in some way, but the banality of a usage like *(alicui) donum* (vel sim.) *afferre (ex quodam loco)* makes one hesitate to accept Peruzzi's claims about what **donom.atoɟerę** must mean in CIL 5; and such a force for *donum portare* in CIL 34 (NB: not *apportare*) seems still less assured.

---

[79] Wachter (n. 551) adds an actual **Pl.**, allegedly found in CIL 204 (cipp. Praen. = Ve 442.3); compare Vetter's somewhat different interpretation of the character (printed in CIL p. 397 as a ligatured PL): Vetter prints as **P.**, with a note "*P.* aus *L* verbessert oder umgekehrt". In fact, CIL p. 718 corrected the original reading by eliminating the P, based on Dessau's autopsy ("Praeneste in museo vidit Dessau excepitque initio P"), and this judgment is now confirmed at CIL p. 871. This second example of "**Pl.**", then, either does not exist or requires further substantiation than Wachter provides.

[80] Cf. Wachter ad loc.: "Hinter dem letzten Wort ist nichts abgebrochen, noch scheint etwas zu fehlen". It seems impossible to explain **port** directly on the basis of *porgo* (= *porrigo*, cf. Ernout-Meillet s.v. *regō*) or *por(r)icio*, without making elaborate assumptions about possible errors (perhaps partly involving one or more syllabic notations).

[81] The important reading **atoɟerę** (for traditional **atoɟero**) has been convincingly defended by Peruzzi "Marsi" 174 (now followed also by Prosdocimi and Marinetti "Terza plurale" 108), although it is unfortunately not noted in CIL (p. 859, "fortasse **atolero**"), despite the citation of Peruzzi's article.

3.3.j There are, however, further comparanda that may be of interest. Note first the (unfortunately lost, but clearly archaic) inscription CIL 393, also from Marsian territory (Aschi, near Ortona). This difficult text poses a number of problems in both reading and interpretation,[82] as will be clear from the annotations (of necessity not exhaustive) to the following sample "transcription":

cdimi(us)[83]
Iove[84]
sacri[85]
costę[86]
fert

The unusual concluding **fert** — the only item which has not, to my knowledge, attracted any comment hitherto — is reminiscent not only of the geographically proximate **donom.atoḷerę** of CIL 5, but also of **donom.port** in CIL 34: indeed, whatever the ultimate solution of **cdimi(us)**, an onomastic interpretation seems assured, such that CIL 34 and 393 are structurally almost identical (assuming also that **sacri** is accusative):

Pl.Specios	**cdimi(us)**
	Iove
Menervai	**sacri(m)**
donom	**costę**
port	**fert**

---

[82] In addition to CIL (pp. 408, 882; Ritschl *Prisc. Lat.* 98E), see in general also Peruzzi "Testi dei Marsi" no. 4 (130ff.), Pocc 224 (both with earlier references), Letta-D'Amato *Epigrafia* pp. 326 n. 5, 350, Prosdocimi *SE* 49 (1981) 311f., and Wallace *Sabellian* 66f.

[83] Durante **C.D.Imi(us)** or **C.Dimi(us)** (cf. Pocc and Wallace locc. cit.); see now also Santoro's extended discussion in connection with possible Messapic personal names beginning *Im-* (*NSM* 2.97 n. 6).

[84] On **Iove** as "Marsian" (cf. **Iove** CIL 2874a = Ve 224a(b), Marruvium): Letta *Marsi* 112 (with n. 27).

[85] Perhaps **sacri(m)** 'rem sacram, hostiam' (Durante, cf. Wallace).

[86] I.e. COSTI', as if **costf** with cursive F (see Prosdocimi loc. cit. for discussion); Letta-D'Amato **Co(n)s(en)tę(s)** (similarly Peruzzi **co(n)s(en)tij)**? Bücheler (CIL)/Durante **costę** = *castē* ? (Mommsen's **C.Ostiḷ(ius)** poses still more severe difficulties.)

The "sacral" usage of *fer-* in Italic is well known (see e.g. Ernout-Meillet *Dict.* s.v. *ferō*), although not always to be taken for granted (cf. **16.6.d** on Volsc. *ferom* Ve 222). But for CIL 34, it may be pertinent — especially in view of the possible Osco-Umbrian provenience of the praenomen abbreviated **Pl.** — that the Umbrian cognate of *portare* appears in a similar official/sacral (although not votive) context: VIIb 1 *fratrexs...portaia seuacne* "the brother-superior shall provide the ceremonial (victim/s)" (similarly VIIb 3 *sue neip portust* "if he does not provide (it/them)").[87] It may be, then, that the use of Lat. *portare* here should be viewed as a kind of calque, based on the (mainly) dialectal use of "sacral *fero*", and partly also usages like that just noted in Umbrian. Note also Fal. *porded*, Umbr. *purdouitu* (native spelling **purt-**) etc., which might conceivably have contributed to the use of Lat. *portare* here. Together with **Pl.**, then, **port** may add another element that renders the background of this document sociolinguistically complex, and that may serve to undermine still further the Roman provenience of the inscription or its composer.

3.4 *Marginalia to CIL 549* **Losna** *(I): On *-sN- Clusters in Latin and Italic*

3.4.a The Praenestine theonym **Losna**, on the third-century mirror inscription CIL 549 (**Poloces Losna Amuces**),[88] is well known for its retention of *-sn-*, with **-ksn-* (IE **louksneh₂*) only partially reduced. What is less clear is whether this preservation simply reflects the phonologically regular "Zwischenform" for this period (cf. Radke *Götter* 190, s.v. *Luna*), or whether it should be considered an orthographic archaism (i.e. a "traditional" spelling), natural enough in a divine name.

---

[87] The interpretation of Fal. *tulom* (Ve259b), sometimes taken to mean 'obtuli' in a votive context, is highly uncertain; see Giacomelli *Lingua fal.* 52, Hirata *L'onomast. fal.* 17 (with further references).

[88] Pp. 428, 903; Wachter *Altlat. Inschr.* §53, Degrassi *ILLRP* 1200 (*Imagines* 369), Ve 366b, Ernout *Recueil* 45, Pisani *Testi* A 22.

It is interesting to compare **Losna** with the divine epithet **Primo.ɔenia**, attested in the well-known third-century Praenestine votive inscription CIL 60,[89] with fully-reduced **Primo.** < **prīsmo-* < **pri-is-m̥(m)o-* (as traditionally) or **pri-isomo-* (Szemerényi *Quellen* 43f.).[90] Wachter's re-examination of CIL 60 (see esp. *Altlat. Inschr.* §§84, 101-104) has highlighted its antiquity, pointing to numerous features that render this inscription among the oldest of the Praenestine bronzes, and therefore roughly contemporaneous with the **Losna** mirror. It is worth reconsidering, then, the nature of the contrast between the two archaic Praenestine divine terms **Losna** (with *-sn-* intact) and **Primo.** (with *-sm-* reduced).

3.4.b In principle, the difference may simply reflect a more conservative naming tradition for **Losna** than for (**Fortuna**) **Primo.ɔenia**: cf. *-sm-* still preserved rather later in the Paelignian sacerdotal title (or name, cf. Jiménez Zamudio *Peligno* 24) *prismu* (Ve 213). On the other hand, it is conceivable that what appears to be a difference in the treatment of *-sn-* and *-sm-* may be linguistically significant. If so, this could take one of two forms: a language-internal explanation might claim a simple chronological distinction between the treatment of *-sn-* and *-sm-*, which could in theory depend on more precise statements of phonetic environment, according to various possible scenarios. Thus, for example, the complex cluster **-ksn-* might remain longer than original **-sm-*, if one assumes that the immediate result was an assimilated sequence *-ssn-*, in turn reduced to *-Sn-* with a "fortis" *-S-*, which might then have resisted voicing to *-zn-* somewhat longer than the same process affecting **-sm-* (> *-zm-*). Alternatively, the difference could be ascribed to external influence, along the lines suggested by Ernout ("Parler" 335): "la conservation des groupes *-sm-*, *-sn-* n'est pas romaine", and further "dans les rares mots où elle nous est attestée, elle s'explique par

---

[89] Pp. 390, 868; Wachter *Altlat. Inschr.* §84, De Rosalia *Iscrizioni* 12, Palmer *Lat. Lang.* 29, Degrassi *ILLRP* 101, Ve 505, Ernout *Recueil* 34, Warmington *Remains* p. 60; see also Euler *Dōnom* 15, and further **12.2.b** below for the reversed C of **Primo.ɔenia** and related problems.

[90] R. Coleman (in *IE Numerals* 408) idiosyncratically **pri-is-mo-* (cf. Leumann *LLuF* 497), as also **mag-is-mo-* > **magsmo-* > **magsumo-* > *maxumus* (*IE Numerals* 438 n. 62), in violation of normal expectations with regard to the assumed syncope and anapytxis.

des influences dialectales, osque, pélignienne ou prénestine." As it happens, the relevant dialectal data pose an interesting problem, which can be taken up after some brief remarks on the attested preserved *-sN-* forms in Latin.

3.4.c There is little to be gleaned from the remaining inscriptional examples of preserved *-sN-* besides **Losna**, and the well-known archaic forms **iouxmenta** from the Forum Inscription (CIL 1) and **cosmis** from the Duenos Inscription (CIL 4). The most important form is the famous **triresmos** of the "Columna Rostrata" (CIL 25.12), which, despite the numerous modernisms and pseudo-archaisms of the Duilius-stele, is usually taken to reflect a genuinely archaic form, i.e. one that may go back to the early third-century original (e.g. Leumann *LLuF* 209: "Lat. *-resmo-* ist kaum nur Erfindung eines Grammatikers"). If so, *-sm-* may still have been intact at that time, although the Latin grammatical tradition was certainly aware of such forms,[91] some of which were certainly genuine,[92] while others were almost as clearly artificial.[93] Thus **triresmos**, even if genuine, might already have been archaizing, as is clearly the case with the second-century **fasni** of *AE* (1987) 323. CIL 581 (SCdeBacch) **dismota** proves nothing, since this almost certainly has artificially restored **dis-** (cf. Ernout "Parler" 335). More fragmentary texts preserve little of value, although an early example of preserved **-sn-** may appear in the vase fragment CIL 2918 (Rome, 4th/3rd-c.)]**asn**[, unless this is]**as**()n[.[94]

3.4.d There are, however, certain interesting facts from Oscan and Umbrian that may provide some insight into the general problem. In his important paper on Italic and Celtic superlatives, Warren Cowgill arrived at the following phonological dilemma (see esp. "Superlatives" 136f.):

---

[91] See Ernout "Parler" 333ff.; e.g. *Casmena(e)* P.F. 59.5 L, Fest. 222.25 L, *cosmittere* P.F. 59.5 L, *dusmo* P.F. 59.3 L (Liv. Andr.), *pesna*/*pesnis* Fest. 228.10 L/222.25 L, etc.

[92] Thus *cesna, cesnas* (Fest. 222.26 L, 228.10 L), cf. Osc. **kersnu**, Umbr. *ŝesna;* on the etymology (as well as a phonological problem with the development of the medial cluster) see now Schrijver *Laryngeals* 432.

[93] Thus probably *osmen* (Varro *L.L.* 6.76, 7.97), evidently based on a folk etymology (cf. P.F. 213.2 L *"Omen velut oremen, quod fit ore augurium, quod non avibus aliove modo fit"*), which produces a morphological monstrosity (cf. Ernout-Meillet *Dict.* s.v. *ōmen*).

[94] The Praenestine fragment]**smo.Magulni**[(thus CIL 3065) is of no value, in light of Solin's plausible preference for [**Art**]ęmo or [**Phil**]ęmo (or possibly a Greek name of the sort Φλάσμων), *Arctos* 24 (1990) 133f.

Oscan and Umbrian superlatives in "*-imo-*" (of the type Osc. *maimas* 'maximae', Umbr. **nuvime** 'novissime') show an unexpected sequence /-īm-/, since *-sm-* (in *-ism-* < **-is-m̥mo-*, in Cowgill's conception) should be preserved, to judge from a number of forms like Umbr. **pusme** 'cui', **esmik** 'huic' (and **ahesnes** 'brazen' for *-sn-*, cf. Osc. αιζνιϲω [Pocc 175] 'ahenea', **fiisnú** 'aedes').[95] To make matters worse, Cowgill further demonstrates (137f.) that previous attempts to explain away one or another of these superlative forms containing unexpected *-im-* (especially via ad hoc phonological mechanisms) are essentially misguided, since all such forms should in principle display the same morphological make-up, and therefore the same phonological environment for the sequence in question.[96] It appears, then, that contrary to Ernout's expectations, an important category of Osco-Umbrian forms, in which *-sm-* is expected to be preserved, precisely fails to show such a sequence, which casts some doubt at least on preserved *-sm-* as an essentially "dialectal" feature.

3.4.e Cowgill's own solution, however, appears at first to be far from satisfying (see "Superlatives" 138f.). To begin with, he simply posits "a common [i.e. Osco-Umbrian — BV] sound change of *-ism̥mo-* to *-īmo-*";[97] then, facing "the problem of exactly how the **s* disappeared", he registers "grave doubts" about "the supposed preservation of internal PIE **-sm-* in Osco-Umbrian", which in turn forces him to try to explain away forms like **pusme** and **esmik**, even claiming that Umbr. **ahesnes** provides the only "tolerably sure" instance of preserved *-sn-*.[98] But **pusme**, in particular, is a form not easily explained away (not to mention the clear

---

[95] On Osc. *maimas*, OIr. *máam*, see now J. Jasanoff, *Sprache* 34 (1988-1990) 180, 182 (explicitly **meh₂-ism̥no-*, in Cowgill's framework). The derivation of Osc. *mais*, *maimas* from a stem **mag-i̯os* (Meiser *Lautgesch.* 38, in support of the early Italic rule *-gi-* > *-ii-*, followed by Schrijver *Laryngeals* 480), is morphologically difficult, on which see Jasanoff op. cit.

[96] As with the traditional interpretations of Umbr. **nuvime**, the analyses offered by Coleman (in *IE Numerals* 413) assume *-ĭ-*, which is not likely to be correct; cf. Cowgill 137f.

[97] Cf. also Cowgill's succinct statement of the problem (140): "Either we posit for Osco-Umbrian a superlative formant *-imo-* (*-īmo-* ?) unknown to the rest of Indo-European and of inexplicable origin, or we admit a development of **-ism̥mo-* to Osco-Umbrian *-īmo-*. The choice is not hard."

[98] It is odd that Cowgill did not mention Osc. **fiisnú** (Ve 1.24), Pael. *fesn* (Ve 216), Umbr. **fesnere/fesnafe** (IIb 11, 16).

instances of preserved *-sn-*), and herein lies the crucial remaining difficulty. Cowgill himself had little to say about this, beyond expressing doubts about the interpretation of the passage in which **pusme** occurs (IIa 40), and offering the tentative suggestion that **pusme** might mean something like 'finally' (< **postmmē*, cf. Osc. *posmom*). Unfortunately (or so it would appear), the interpretation of Umbr. **pusme** as 'cui' now seems securely buttressed by SPi. *posmúi* 'cui', which admits of very little doubt.[99] It is possible, however, that a more detailed consideration of the South Picene data may suggest a more attractive solution to the conundrum just described — indeed, a solution in which Cowgill's conception of the phonological development may turn out to have been essentially correct.

3.4.f The relative function of SPi. *posmúi* is clear from the parallel attestations in TE 7 and TE 5:

toúta [nom.] *tefeí* [dat.] *posmúi praistaínt* (TE 7)
trebegies [nom.] *titúí* [dat.] *praistaklasa posmúi* (TE 5)

For the dative preceding *posmúi*, cf. further *ímih puíh* 'eis qui/quibus' (AP 2), and the discussion of these constructions by Marinetti.[100]

What is potentially of great interest, however, is that the third (and only other) attestation of SPi. *"posmúi"* seems to show something comparable, vis-à-vis the *posmúi* of TE 5 and TE 7, to the *-sm-* vs. *-m-* problem discussed above: in AQ 1, we find the sequence

[k]aúieh [dat.][101] *kaúieis puqloh* [dat.] *praistaít pom[*

---

[99] Cf. Meiser "Pälignisch" 106 on this comparison as a significant morphological archaism shared by South Picene and Umbrian.

[100] *Iscrizioni* 131, 133, 140; also 118 for explicit comparison with Umbr. **pusme**; for different interpretations of *puíh*, see Meiser "Pälignisch" 120 (**kʷō-id* 'womit, wodurch', with query) and Eichner "Pietas" 196 with n. 7 (nom. sg., cf. Osc. **pui** etc.). For *praistaklā-*, see also C. de Simone, *Glotta* 65 (1987) 125ff.

[101] Thus correctly, in my view, Meiser "Pälignisch" 115 ("(... der Stein) steht da für (...) Gavius (GE.), Sobn des Gaius (Prän.)"), contra Marinetti *Iscrizioni* 152, who takes *kaúieh* as nom. sg.; differently now also Eichner "Pietas" 196 n. 7 (vocative, with "hypercorrect *-h*", and *puqloh* abl. [cf. **7.7.i** n. 66], i.e. "o Gaius, von des Gaius Sobn", comparing CIL 10 **te ... Publi | prognatum.Publio**), but the parallels with TE 5 and TE 7 do not favor Eichner's case interpretations.

in which the parallel syntactic patterning with TE 7 and TE 5 is evident (thus Marinetti *Iscrizioni* 152, Meiser "Pälignisch" 115f.),[102] and which nonetheless gives us a form *poṃ[úi]*, and not *posmúi*.[103] Concerning this variation, Marinetti registers the following query: "**pomúi* : con caduta di *-s-* per errore di incisione o per fonetica *-sm-* > *-m-*?" The former possibility, in truth, cannot be excluded; but neither can the latter hypothesis be rejected out of hand, which, if correct, would have interesting consequences for the problem under discussion. If, then, *poṃ[* is taken to reflect a version of *posmúi*,[104] and if this spelling is not simply an error, it might show synchronic variation *posm-* ~ *pom-* already for South Picene. This, in turn, could be taken to mean that Cowgill's conception was essentially correct, although his explanation for Umbr. **pusm-** must be revised, and his ad hoc sound change stated more generally. SPi. *pom-*, in other words, would show the phonologically regular result of the early loss of *-s-* in sequences *-Vsm-*, as in Osc. *maimas*, Umbr. **nuvime**; SPi. *posm-* and Umbr. **pusm-** can then be explained as showing analogical restoration (or retention) of *-s-*, for which pressure could have been exerted by SPi. pronominal *esm-* (loc. *esmín* etc.) on the one hand, and Umbr. *esmei* 'huic' on the other. The preservation of *-sm-* in these forms, in turn, would have been favored by the *es-* of pronominal *est-* (SPi. *estas/estuf/estufk;* Umbr. **estu** etc.), as well as (in the case of Umbrian) the pronominal stem *es(s)o-* (< **ekso-*) of *es(s)u* 'hōc' etc.[105] If, then, *-sm-* is unstable in South Picene,

---

[102] See also Meiser op. cit. 123 n. 95 on the alliterative sequence *praistak- posm-* in TE 5, cf. here *(puq-) praist- poṃ[*.

[103] Marinetti's index entry for this form (267) reads "poṃ[*opp.* pon̪[", in accord with her note (237) on the character in question. But the facsimile (235) shows angular strokes consistent with *m*, although wrongly oriented for *n:* these strokes have much the same appearance as the fragmentary first character of AQ 1, and also the fragmentary character before *ínoh*, for both of which Marinetti judged *m* to be the more probable interpretation; cf. also Prosdocimi "Studi 1980" 244: "la lettera verosimile è *pom[* ". The photograph (fig. 27) is unfortunately unclear at this point, although what is visible appears surely to exclude *s*.

[104] Prosdocimi "Studi 1980" loc. cit. takes *poṃ[* as a gentilicium (*Pompilius* vel sim.), but this ignores the parallelism with TE 5 and TE 7, and depends on the assumption that *kaúieh* is nom. sg. (cf. n. 101 above).

[105] Even if Ital. **iste/*este* reflects a reanalyzed stem **is-/*es-* based on pronominal **e i-/*i-* followed by enclitic **-te*, cf. Lat. *easte* (augural formula), Hispano-Celt. *iśTe* (J. Êska, *Emerita* 57 [1989] 317ff.), the reanalysis seems to have been established in Umbrian and South Picene early enough for stems *est-* to have influenced *esm-*. On Umbr. **ekso-* and the treatment of **ks* in Umbrian and elsewhere, see Meiser "Pälignisch" 109f. with n. 38.

and if the attested Osco-Umbrian forms with *-sm-* can be explained secondarily, then the contrast between Umbr. **nuvime** vs. **ahesnes** (and Osc. *maimas* vs. *casnar*, **fiisnú**) may be phonologically real (as Cowgill's analysis seemed to suggest), reflecting a chronological difference in the development of **-sm-* and **-sn-* in Sabellian. In principle, a Latin counterpart to this distinction might also be visible in the contrast between **Primo.** and **Losna**, although the possibility of archaizing orthography for **Losna** (as perhaps also in Pael. *prismu*) does not allow for a clear judgment, as already noted.

3.5 *Marginalia to CIL 549 Losna (II): Lat. mōnstrum, lūstrum and Secondary Instrument-Noun Formations*

3.5.a B. Olsen's recent monograph on the PIE instrument noun suffix **-tlo-* and its variants (*Instr. Noun*) is mainly concerned with reconstructing the original form of the suffix, as well as the phonotactic principles that account for its variants. She provides, however, an attractive hypothesis about the original morphological structure of the suffix that explains the high degree of variation found in its patterns of accent (both oxytone and barytone) and ablaut (both *e*-grade and zero grade), as well as some facts of gender (esp. the frequent appearance of feminines beside neuters): according to Olsen, these formations are "generally clearly derived from verbal roots" (*Instr. Noun* 3), and show "an original interrelationship between a root-accented thematic neuter, and a suffix-accented collective formation" (*Instr. Noun* 4), thus e.g. **térh_1-tro-m : *tr̥h_1-tráh$_2$*, to **terh_1-* 'drill, bore'. Finally, as is to be expected in such a pattern, "various analogical levellings would have obscured the original ablaut pattern". But there are two types of facts about instrument nouns that cannot be so easily integrated into this system, as Olsen acknowledges (passim, in her discussions of individual forms):

(i) forms that, descriptively speaking, appear to have a thematic vowel interposed between the root and the suffix, e.g. **u̯egʰ-e-tlo-* (Skt. *vahítram* 'vehicle, ship', Lat. *vehiculum*, Gk. ὄχετλα· οχήματα Hsch., *Instr. Noun* 13);

(ii) forms (generally isolated) with *o*-grade (relatively frequent in Germanic), e.g. ON *látr* 'lair' < **logh-tro-*, vs. **legh-tro-* in Gk. λέκτρον 'bed', OHG *lehtar* 'womb, afterbirth' (*Instr. Noun* 9), or OIr. *foccul* 'word', Welsh *gwaethl* 'quarrel' < **ǫokᵘ-tlo-* (beside ambiguous Skt. *vaktram* 'mouth', *Instr. Noun* 12).

For type (i): Olsen explains this "insertion of a secondary vowel between root and suffix" as follows (*Instr. Noun* 13f.): "This process may well have started already in the proto-language, particularly in roots with a final stop, and with no sonants to be vocalized. If we accept the proposed theory that these derivatives originally had ablauting paradigms, such roots would be inconvenient for the formation of zero grades, (cf. OIr. *scél* < **skᵘe-tlom*), from which the process may, little by little, have spread to some full grade formations as well".

For type (ii): these are in general explained, as often with similar phenomena (cf. **9.3.b** below), on the basis of secondary influence from related forms with *o*-grade, mostly nominal; thus for OIr. *foccul*, "The o-vocalism of the root ... is possibly taken over from the root noun **ǫōkᵘs*", and ON *látr* "must have introduced the o-vocalism of the root from another derivative (e.g. *lag* 'position' < **loghom*)".

3.5.b If the unexpected vowels in (i) were indeed "secondarily inserted", a phonetic explanation of the sort Olsen proposes would in principle be acceptable. But it is not clear that these vowels are best interpreted in this way, and the particular explanation offered has several difficulties. Note first that if cases with a structure like that assumed as the "ideal" basis of OIr. *scél* reflect the original environment for this insertion (i.e. **skᵘ-tlo-*), the insertion of a vowel **-e-* — and that with a high degree of regularity, as will be seen shortly — is not necessarily expected: as a classic "schwa secundum" environment, one might rather expect the new vowels to appear in a variety of forms from language to language, consistent with the vocalism found in so-called secondary zero-grade formations (thus probably *-a-* for Celtic, see in general Joseph *IE Laryngeals*, esp. Chapters 2 and 3). Secondly, the type *scél* is in fact quite rare: most of the examples of "inserted vowel" show *-e-* in roots that *do*

have "vocalizable sonant" (as in **ǵeĝh-e-tlo-*); thus, if the process began with forms like *scél*, it is difficult to see how and why it could have spread so far beyond its original bounds, especially since the presence of a cluster itself is clearly not sufficient to condition a vowel-insertion (cf. **legh-tro-* etc.).

There is, however, another correlation visible in the forms with "inserted vowel", but of a morphological nature: it seems striking that most cases correspond precisely to roots for which thematic inflection is clearly old (see in general Hollifield, *System of Conj.* Ch. 6): thus

**ǵeĝh-e-tlo- : *ǵeĝh-e/o-* (Lat. *vehō* etc.)
**seĝh-e-tlo- (-tlah$_2$)* [106] *: *seĝh-e/o-* (Gk. ἔχω etc.)
**sreu̯-e-dhro-* [107] *: *sreu̯-e/o-* (Gk. ῥέω etc.)
**sku̯-e-tlo- : *s(e)ku̯-e/o-* (Gk. ἐν(ν)έπω etc.)[108]

and perhaps also **bher(h$_1$)-e-tro-/*bhṛ(h$_1$)-e-trah$_2$*, at least according to one of the possibilities for interpreting forms like Gk. φέρετρον 'bier', φαρέτρα 'quiver', and (indirectly) Skt. *bharítram* (cf. *vahítram* above).[109] In the last example, one can of course operate instead with a seṭ variant **bherh$_1$-*, which could account for some forms directly, i.e. without thematic vowel (thus **bherh$_1$-tro-* > φέρετρον, with the second epsilon a vocalized laryngeal, as in τέρετρον); see Olsen *Instr. Noun* 10 for further discussion.[110] In other cases, it might be claimed that an original "root formation" was replaced at a relatively late (i.e. einzelsprachlich) date by a "thematized" version, based on a widespread thematic verb in the language in question, together with the fact that in some languages, certain forms of the instrumental suffix acquired some degree of productivity: thus perhaps ῥέεθρον (not **ῥέυτρον vel sim. for expected **sreu̯-tro-*), after themat.

---

[106] Gk. ἐχέτλη 'plough handle', perhaps also Welsh *haeddel*, MBret. *haezl* 'id.', but see Joseph *IE Laryngeals* 287f. for the problem of the *a*-vocalism, which may in turn require these forms to have a different morphological make-up from ἐχέτλη.

[107] Gk. ῥέεθρον 'stream', perhaps for original *ῥέετρον (see Olsen *Instr. Noun* 34).

[108] Schrijver's interpretation of OIr. *scél* via a formant **-etlo-* has no morphological basis, despite his comparison with W. *gwaladr* 'ruler' (allegedly < **u̯lh$_2$-etro-*), on which see rather L. Joseph, *Ériu* 33 (1982) 42.

[109] Thus explicitly e.g. F. Bader (in *Laryngales* 17 n. 47).

[110] Bader (loc. cit. and 23 n. 71) sees a thematic formation ("dérivé secondaire") in τέρετρον as well.

*ῥέϝε- and productive -θρο-.[111] Nevertheless, there remains the possibility that some such forms are relatively old, as perhaps most clearly for **ɥeĝh-e-tlo-*. It may be advisable, then, to admit a form of secondary derivation for at least some instrument nouns, according to which the formation is based not on the root but on a verb stem (cf. Bader's conception of φέρετρον and τέρετρον). Indeed, this would not be particularly surprising, in view of the meaning of the suffix itself ("das Mittel oder Werkzeug zum Vollzug einer Handlung oder den Ort, wo sie vollzogen wird", in the Wackernagel-Debrunner formulation cited by Olsen *Instr. Noun* 3).

3.5.c Turning now to the formal problem posed by the *o*-grades in set (ii) (**3.5.a**): the idea of influence from parallel *o*-grade formations is surely correct in some cases, but it is important to circumscribe the proper application of such an account. Ideally, for this sort of explanation to be appealing, the *o*-grade formation in question should be attested in a way that renders the analogical transfer of root vocalism more likely. Thus for Hsch. ὄχετλα (**3.5.a** (i) above), Olsen observes that the form "has probably taken over its root vocalism from the verb ὀχέω/ὀχέομαι" (*Instr. Noun* 13). This idea is likely to be correct, not only because of the general prominence of ὀχέω (and its many other derivatives with stem-form ὀχ-), but also more specifically because *e*-grade forms of the root are in fact virtually unattested in Greek (apart from a few dialect forms of the type Pamph. ϝεχετω), and because the aberrant *o*-grade form of the instrument noun is attested in this branch alone. But such an explanation is not nearly so attractive in some other cases of *o*-grade instrument formations, especially when the *o*-grade has a chance of being inherited. If, moreover, the above suggestion concerning the secondary type **ɥeĝh-e-tlo-* is correct, it becomes possible to seek other sources for unexpected *o*-grades based on *o*-grade verbal formations.

A particularly recalcitrant *o*-grade instrument noun appears in the Germanic forms for 'oar, rudder', OHG *ruodar* etc., which clearly point to

---

[111] Similarly Lat. *arātrum* (for expected **aratrum/*aritrwn*) probably after *arāre* (e.g. Serbat *Dérivés* 317ff., Schrijver *Laryngeals* 108). I cannot follow Bader (in *Laryngales* 40) and A. Christol (ibid. 107 n. 12) in ascribing the vowel length of *arātrum* to the regular development of an Indo-European syllabification **$h_2e.rh_3$-*.

a **h₁roh₁-tro-* beside the **h₁erh₁-tro-* of Ved. *arítram/áritram* (cf. also zero-grade in Li. *ìrklas*).[112] Olsen (*Instr. Noun* 11) points out that the Germanic form "would seem to be something as bizarre as an o-grade schwebeablaut form of **h₁erh₁-*"; but this is a classic Schwebeablauting root in any case (cf. Anttila *Schwebeablaut* 127), and this feature therefore need not prejudice the interpretation of the form unduly: it is mainly the vocalism that requires explanation. The "evident solution" Olsen reports (attributed to J. E. Rasmussen) strikes me as highly unsatisfactory, namely that the Germanic form is borrowed from a corresponding Celtic zero-grade form (Celt. **rā-* < **h₁r̥h₁-*) before Gmc. **ā* > *ō*. Aside from the extreme unlikelihood that such a term would need to be borrowed by such peoples at such a time,[113] the attested Celtic forms do not in fact show an instrument-noun formation (OIr. *rámae* 'oar' etc., Joseph *IE Laryngeals* 144), and have little chance of reflecting zero grades (thus *rámae* rather < **rō-mi̯o-*, cf. *raïd* 'rows', verbal noun *rám* < **rō-mo-* [Joseph loc. cit.], parallel to the clearly primary Gmc. verb of OE *rōwan* etc.). Beside this **h₁roh₁-/*h₁roh₁-mo-*, moreover, stands Lat. *rēmus* (cf. **3.4.c** above on CIL 25 **triresmos**), for which the most straightforward analysis is simply **h₁reh₁-(s)mo-*.[114] What such forms may point to rather is an athematic *o-/e*-present **h₁róh₁-/*h₁réh₁-*, of the so-called *"molō* type" reconstructed by J. Jasanoff (in *Heth. u. Idg.* 83ff.).[115]

The **h₁roh₁-tro-* pattern, moreover, is not isolated. Gk. λόετρον 'bath', to be sure, can be explained on the basis of an *e*-grade **leu̯h₃-tro-* via the metathesis rule needed for a number of other forms (Myc. *re-wo-*

---

[112] N. Oettinger in *Heth. u. Idg.* 201 n. 23.

[113] I am indebted to Mark Southern for discussion of this point.

[114] I.e. **h₁reh₁-mo-* (like Celt. *rámae*), or **h₁reh₁-smo-*, if the -s- of **triresmos** is old. The **(h₁)ret-smo-* or **(h₁)ret-mo-* sometimes reconstructed (e.g. Ernout "Parler" 334) is to be rejected, on which see Schwyzer, *KZ* 63 (1936) 55ff., with discussion of the secondary origin of the -τ- of ἐρετμόν, including important remarks on the precarious status of a Gk. reflex of **h₁reh₁-mo-* (> **ἐρημο-*) and the absence of a corresponding verb **ἐρη- 'row' (cf. next footnote).

[115] Note that for Latin, the expected *ē*-inflected verb **rēre* 'row' (cf. *-plēre* 'fill' to **pl̥eh₁-*) may have been eliminated via "homonymie fâcheuse" (cf. *rērī* 'think'), whence the denominative *rēmigāre* based on *rēmex*, in much the same way that a Gk. **ἐρέω* replacing the athematic **ἔρειμι*, reconstructable for Greek on the basis of Myc. *e-re-e*, ran afoul of ἐρέω 'say', whence the denominative ἐρέσσω (see R. Plath, *MSS* 51 [1990] 177f., and already Schwyzer loc. cit.), and Ved. **áriti* or the like faced excessive competition from other *ar-* roots (Mayrhofer *EWAia* I.2 s.v. *aritár-*).

to-ro-ko-wo vs. Hom. λοετροχόος; στορε- to **sterh₃-*, etc.); but the Germanic forms (ON *lauðr* 'lather' etc.) require *o*-grade, which can also explain the Celtic forms (OIr. *lóathar* 'basin' etc.), and which is simplest for the Latin forms as well (*lābrum* 'basin', *lātrīna* 'drain', both with **lava-* < **lou̯H-*, cf. *caveō* etc.).[116] Note also the following, which are somewhat less clear but possibly old:

**(h₁)ois-tro-:* Gk. οἶστρος 'rage', Li. *aistrà* 'passion', cf. Lat. *īra* etc. (Olsen *Instr. Noun* 16, see now also Mayrhofer *EWAia* I.4 s.v. *eṣ*[2]);

**u̯rop-tro-:* Gk. ῥόπτρον 'door-knocker [etc.]', OE *ræfter* 'rafter' (Olsen op. cit. 8), cf. ῥέπω 'sink, incline', zero grade perhaps in ῥαπίζω 'strike';[117]

**(H)roh₂d-tro-:* Lat. *rōstrum* 'beak' (cf. *rōdō* 'gnaw'), beside **(H)reh₂d-tro-* in Lat. *rāstrum* 'hoe' (cf. *rādō* 'scrape') (Olsen op. cit. 28)[118]

Another suggestive (and possibly old) form, although difficult to evaluate in view of the absence of cognates with the same formation outside Anatolian, is the **souh₁-e-tro-* of Hitt. *šāwātar*, Pal. *šawitra-* etc. 'horn' elucidated by N. Oettinger (in *Heth. u. Idg.* 197ff., cf. 201 for comparison with "thematischem **-e-tlo-*" in OIr. *scél*).

3.5.d We are now in a position to consider Lat. *mōnstrum* 'portent' (not treated by Olsen), which poses three problems: (i) its *o*-grade vocalism, (ii) the apparent formant **-stro-* instead of **-tro-*, **-tlo-* etc., and (iii) its semantic derivation from **men-*, which does not match the usual meanings of instrument formations in an obvious way.

Note first that features (i) and (ii) are very likely old for this word, within Italic, if one accepts Marinetti's highly plausible comparison of SPi.

---

[116] On these forms see Olsen (*Instr. Noun* 10, 18) and esp. Schrijver (*Laryngeals* 445, 453), with arguments for **louh₁-* as opposed to **louh₃-*, and explicit interpretation of the *o*-vocalism as old (even for λόετρον), comparing Go. *malan*, Li. *málti* 'grind'.

[117] For the Gk. *o*-grade one could appeal to forms like ῥόπαλον 'club', ῥοπή 'inclination', if not for the Gmc. comparison.

[118] Beekes' proposal to separate *rōdō* and *rādō* (see the discussion, with references, in Schrijver *Laryngeals* 309f.) seems to depend in part on an unnecessarily severe application of the principle that "*o*-grade in a verb is improbable".

múfqlúm (TE 5) with Lat. *mōnstrum* (*Iscrizioni* 118, 127, accepted by Eichner "Heldendenkmal" 204), which could be identically-formed, apart from the use of **-stlo-* (> **-sklo-*) in South Picene vs. Lat. **-stro-*, more on which in the next section. In view of the apparent lack of syncope in the second (closed) syllable of SPi. *mefistrúí* (TE 5, perhaps with **-is-t(e)ro-*, cf. Lat. *magister* etc; Marinetti *Iscrizioni* 118, 121),[119] it would seem preferable to take *múfqlúm* simply from a **mon-sklo-* rather than **moni-sklo-* or **mone-sklo-*, despite the **moni-stro-* or **mone-stro-* generally set up for Lat. *mōnstrum* (e.g. Leumann *LLuF* 313, Serbat *Dérivés* 347, cf. also J. Jasanoff *HS* 104 [1991] 99 n. 30 on *monitus* and *monerint*).

Taken together with the above suggestion concerning secondary instrument-noun derivatives, the most natural solution for problem (iii) automatically provides a solution for problem (i); that is, the semantics of *mōnstrum* make eminently good sense as being based on the causative stem **mon-éi̯e/o-* (i.e. 'portent' = 'implement [so to speak] for warning', as is often thought in any case, see e.g. Leumann loc. cit., Ernout-Meillet *Dict.* s.v. *moneō*), which in turn provides a natural morphological source for the *o*-grade, provided one allows for the secondary derivation of (at least some) instrument nouns.

3.5.e The contrast just mentioned between SPi. **-stlo-* and Lat. **-stro-* is potentially of some interest with regard to the remaining problem, i.e. (ii), the form of the suffix. Note first that one of Olsen's principal findings is that **-tro-* was originally restricted to roots containing a liquid, while **-tlo-* is found elsewhere (see *Instr. Noun* 27ff. for the Latin data). In this respect, then, Lat. *mōnstrum* is aberrant vis-à-vis the **mon(V)-stlo-* underlying SPi. *múfqlúm*, and both have the unexpected *-s-* before the instrument-noun suffix. Since it is **-tlo-* (and not **-tro-*) that has become productive in Italic (see Olsen op. cit. 31), the suffix-form *-tr-* of Lat. *mōnstrum* is best ascribed to some analogical source: the evident candidate is *lūstrum*, in which **-tro-* is regular (according to the distribution assumed by Olsen), and which also provides a source for the unexpected *-s-*. The *-s-* of *lūstrum*, in turn, poses far less difficulty, since

[119] See now Eichner "Heldendenkmal" 200, 206 for a different analysis; compare, in any case, the syncope in the second (open) syllable of SPi. *opsút* (AQ 2), *o]psúq* (TE 7) < **opes-*, as in Osc. **úps-** etc.

the stem-form **leuks-* or **louks-* (in **le/ouks-tro-*) can be explained on the basis of a reanalysis of the **louksnā* underlying CIL 549 **Losna**, in which the **-s-* is inherited;[120] i.e. originally **louk-sn-ā*, reinterpreted as **louks-nā*, cf. also **le/ouks-men* > *lūmen*, whence in turn *flūmen, frūmentum, sūmen* etc., as if from a newly-reanalyzed *"-smen"* (after velars), cf. Leumann *LLuF* 370f.[121] In schematic form, then, the developments would have been somewhat as follows:

	(**louk-sn-ā :*) **louk-tro-*	**mon-tlo-*
>	(**louks-nā :*) **louks-tro-*	**mons-tlo-* (SPi. *múfqlúm*)
>	(**louks-nā :*) **loukstro-*	**monstro-* (Lat. *mōnstrum*)[122]

Fundamental to this conception is the assumption of an archaic "sacral" pairing of the two demonstrably old ritual terms *lūstrum/mōnstrum*, as the strong augural component of Latin and Italic *lustratio* would lead one to expect in any case.

Strictly speaking, as already indicated, there are a number of indeterminacies, such as the presence or absence of syncope in **mon(V)-stl/ro-*, and also the vocalism of *lūstrum*. Those who etymologize this term on the basis of **leuk-* (as opposed to **leuh$_{1/3}$-* 'wash')[123] generally reconstruct with *e*-grade **leukstrom;* but the above conception is perhaps easier if both *mōnstrum* and *lūstrum* originally had *o*-grades. In this case, a **loukstrom* could again be based on the causative stem

---

[120] Av. *raoxšna-* 'bright', OPr. *lauksnos* 'Gestime' etc. (see now also Mayrhofer *EWAia* I.8 605 on Ved. *jyótsnā-* 'moonlit night, moonlight'); on the formation, see O. Panagl, *Studies Palmer* 276f. (following Benveniste *Origines* 100ff.), although E. Tichy (*MSS* 38 [1979] 225 n. 44) seems to favor derivation from an *s*-stem, as opposed to Benveniste's **-ser/n-*stem basis. The recent discussion of Hitt. *-eššar/-ešnaš* heteroclitics by Alvarez-Pedrosa (*Emerita* 58 [1990] 185ff.) seeks to reinterpret these as *s*-stem abstracts (following Sturtevant), but confusingly adduces Benveniste's understanding of Lat. *lūna* in this connection, which in fact makes no reference to *s*-stems.

[121] Although some (mostly not archaic) Latin *-str-* formations owe the form of their suffix to a **-stro-* abstracted from the dental + dental result of **-D-tro-* seen in *rōstrum/rāstrum* etc. (cf. Serbat *Dérivés* 345, Olsen op. cit. 28, also Hamp, **3.5.f** below), this need not be the correct (or even the preferred) explanation for *lūstrum*, the formation of which is at least as old as that of *rōstrum* etc.

[122] I.e. *mōnstrum* for **mōstrum*, with *-n-* restored after *moneō;* for the expected treatment, cf. the diminutive **mōstellum* 'ghost' underlying *Mōstellāria*.

[123] For convincing (in my view) arguments in favor of **leuk-*, see esp. H. Petersmann, *WJA* 9 (1983) 209ff.

**louk-éi̯e/o-* (cf. OLat. transitive *lūcēre*, Leumann *LLuF* 541), thus providing a clearer semantic derivation for original meanings like 'tool [> procedure?] for illuminating' and the like (see Petersmann op. cit. for discussion [*lūstrāre* originally 'beleuchten']).[124] If this is correct, then the secondary instrument-noun formation based on a causative stem — of the type already assumed for *mōnstrum*, and structurally comparable to other non-root formations involving thematic stems and athematic *o*-/*e*-verbs — would at least be quite old within Italic.

3.5.f The ingenious (but exceedingly involved) solution to the formation of *lūstrum* and *mōnstrum* proposed by Hamp (*RhM* 129 [1986] 362) has several drawbacks, quite apart from his preference for the 'wash' etymology for *lūstrum*. Hamp assumes, first, a simple **-to-* formation comparable to OPr. *dalptan* 'chisel', Lat. *hortus*, although he does not discuss the nature of the *o*-grades; nevertheless, his understanding of **mon-to-* (glossed as 'means of reminding, warning') implies a causative-stem basis, otherwise apparently absent in his **lou-to-* 'means of washing, purifying'. Even if such stems were then resegmented, as he suggests, as **mont-o-*/**lout-o-*, the subsequent "reinforcement" with "productive **-tro-m*" (whence **mont+tro-*, **lout+tro-*) is problematic, since, pace Hamp, **-tro-* was not productive in Latin (cf. **3.5.e** above). Finally, the hypothetical (if credible) phonological developments Hamp specifies for the resulting **-ssr-* > **-str-* (with "intrusive *-t-*") in **loussro-*/**monssro-* — necessarily distinct from simple**-sr-* > *-br-* — can simply be dispensed with by assuming that the *-s-* of *mōnstrum* is secondary after that of *lūstrum*, as outlined above.

3.6 *Marginalia to CIL 549 Losna (III): Etruscan tusna*

J. Puhvel (*AJP* 105 [1984] 209ff.) has interpreted the Etruscan word *tusna*, inscribed above a swan on a mirror (Gerhard *Etr. Spiegel* 4, no. 322), as the Etruscan word for 'swan', itself borrowed from a hypothetical

[124] For the relative "weight" of this causative stem, note also A. Bammesberger's discussion of its effect on the stative *lūcēre* 'be bright' ("ideal" structure **luk-eh₁-*), with anomalous full grade (*Glotta* 64 [1986] 101f.).

Umbrian **dosno* (with *d-* < **l-*), thereby providing another Italic attestation of **louksnā*. But this interpretation seems to me to be very doubtful.

Puhvel observes first that since named swans are not common, the form in question is likely to be the Etruscan word for 'swan'. But this named figure appears together with the two named deities in the center of the mirror, and is therefore almost certainly, like these, a named divinity or mythological figure.[125] (The two other animals at bottom left and right are not named, nor are other swans appearing on Etruscan mirrors.)

Secondly, Puhvel's scenario whereby IE **louksno-* 'shiny' (cf. Av. *raoxšna-*) ended up producing an elliptical Italic phrase **lousnā (avis)* founders on the almost exclusively astral reference of **louksno-* and (especially) its substantivized derivatives (cf. N. Oettinger, *Glotta* 59 [1981] 11ff.).

Thirdly, the presumed unexpected treatment of initial **l-* in the supposed Umbrian source of Etr. *tusna* cannot adequately be defended (pace Puhvel) by invoking the (intervocalic!) treatment of forms like Umbr. **fameřias**, or by invoking the similar (and, to be sure, well-attested) process **d* > *l* (as in Lat. *lacruma, lēvir, lingua* etc., together with various "Mediterranean" vocables in Greek and Anatolian) and the attendant claim that "the *d:l* fluctuation is endemic in areal context" (p. 209); nor is it justified to emphasize (p. 212 n. 6) the small number of Umbrian examples of the treatment **l-* > *v-*, as against the complete absence of other Umbrian cases of **l-* > *d-*.[126]

Finally, the *actual* Etruscan borrowing of Italic **louksnā*, which may well have entered the language via an Umbrian form, more likely appears in Etr. *lusχnei* (TLE 290), on which see Meiser *Lautgesch.* 157f., 170.

---

[125] Thus e.g. Bonfante and Bonfante *Etr. Lang.* 150 s.v. *Tusna* ("The swan of Turan").

[126] For the Umbrian treatment, cf. now also SPi. *veiat* 'lies' (**legh-i̯ā-*), *vepet-* 'stone' beside *lepet-* (cf. Lat. *lapid-*, Umbr. vapeře, Gk. λέπας etc.); Meiser *Lautgesch.* 155ff., "Pälignisch" 106, further **6.4.f** and **8.8.d** n. 49.

CHAPTER FOUR

Inscriptions from Oscan- and Umbrian-Speaking Areas

4.1 *On "Oscan Influence"*
4.2 *CIL 2489*
4.3 *Notes on the Paleography of Campanian Inscriptions*
4.4 *CIL 3121* **nocerei**
4.5 *On Some Monophthongizations of *ai and *au in Inscriptions from Umbria and the North Coastal Area (CIL 3292a, 3374, 1899)*
4.6 *CIL 382*
4.7 *CIL 1926*

4.1 *On "Oscan Influence"*

4.1.a Wachter, in his treatment of the early inscriptions from Campania (*Altlat. Inschr.* §§183-5), insists on the absence of linguistic traits attributable to Oscan influence (cf. §2 of the "Introduction"). Thus for CIL 399 from Cales (§184a), and for the numerous inscribed pieces of "Cales ware" (§184b, see further **4.2** below), Wachter enumerates (p. 400) a series of forms and features linguistically inconsistent with Oscan: e.g. **fec-** (vs. Osc. *ops-*), dat./abl. pl. **-bus** (vs. Osc. **-ifs, -íss** etc.), CIL 2487 **serv** (cf. Pael. *famel*, Osc. *famel* P.F. 77.11 L), among others; and for CIL 1581 and 1582 from Capua (§185), Wachter observes (correctly) that "[d]ie sprachlichen Merkmale zeigen keinerlei oskische Einflüsse".

In a similar way, Eska's study of Pompeiian Latin inscriptions leans toward the same conclusion: "...it is possible, if not probable, that the Pompeiian features were inherent in the Latin language" ("Pompeii" 159).

4.1.b This conception of the generally non-Oscan linguistic behavior of Latin documents from this area is surely accurate in the main; but it should not be viewed in absolute terms. The appearance of a feature like *fec-* as opposed to *ops-*, while clearly indicative of something, is after all a crude index: there is not much reason to expect to find, for this early

period, an "Oscanized Latin" (with such typically lexical marks of "code-switching" as *ops-* for *fec-*), comparable to later (and sociolinguistically predictable) documents that can be described as "Latinized Oscan" (as in the Cumae defixio CIL 1614 = Ve 7).[1] Nevertheless, this does not exclude the possibility that any number of relatively subtle "non-urban" features might still be traceable to Oscan influence in at least a few documents. These could include such features as an Oscan-style patronymic expression without **f.**, as in the interesting early Campanian inscription CIL 400, to be discussed in detail in Chapter **12** (**12.2**) in connection with the possible use therein of an unusual form of ligature. Indeed, in addition to certain facts about ligatures, there is a broad range of non-urban orthographic and paleographic features that might manifest themselves in otherwise Latin texts, several of which will require more extended discussion below (esp. Chapters **11-16**). In allowing such data, then, to enter into consideration, we arrive at a more accurate and revealing (if sociolinguistically more complex) characterization of this linguistic area, beyond the monolithic Latinization implied by Wachter's treatment. It is from this perspective that I address certain problems of interpretation in a piece of Campanian "Cales ware" (**4.2**), leading in turn to consideration of several points of Campanian paleography (**4.3**).

4.2 *CIL 2489*

4.2.a The "titulus loquens" CIL 2489,[2] on an earthenware patera mold from Capua, belongs to the well-known set of inscriptions found on Campanian "Cales ware" (cf. **4.1.a**). Like the other productions inscribed with the artisan's name "L. Canoleios", it appears to date from the late third century B.C.[3]

---

[1] Cf. Camparile "Latinizzazione" 120 on the difficulty of defining the precise dialectal mix in this text, and more generally (on "Latinized Oscan") also **11.5.d** below.

[2] Pp. 721, 885; Wachter *Altlat. Inschr.* §184b, Agostiniani *Iscriz. parlanti* 598, Degrassi *ILLRP* 1220, Warmington *Remains* p. 202, Pagenstecher *Reliefkeramik* no. 133u.

[3] For the dating, see esp. Pagenstecher *Reliefkeramik* 165 on the L. Canoleius pieces, and more generally CIL p. 884; as for the lettering, note especially angled L and open A; the upright N printed in CIL is difficult to credit (cf., among many other examples that could be cited, the inclined N of CIL 406a **Canoleius** [Degrassi *Imagines* 372], and further

The CIL reading is as follows:

L Canolei.o.f.f.sum

This is an instance in which Degrassi's and Warmington's practice of systematically ignoring the facts of word-division is particularly unfortunate. As will become clearer below, a transcription like *L. Canolei off. sum* (Warmington, similarly Degrassi *ILLRP*) simply imposes a traditional (and problematic) interpretation on the sequence printed in CIL as **o.f.f.**; Agostiniani, in contrast, while opting for a similar interpretation, accurately reproduces the CIL transcription, and refers to Pagenstecher's treatment, where it is stated that the object is considerably worn and the inscription difficult to read with complete accuracy.[4]

4.2.b The initial genitive **L Canolei** is unique for this series, as is the puzzling sequence **o.f.f.sum** itself, on which the genitive **L Canolei** must somehow depend. The inscription is generally interpreted as either *L. Canolei off(icina) sum* "I am the workmanship of L.C.",[5] or *L. Canolei off(icinae) sum* "I am (a product) of the workshop of L.C."[6] But Wachter has observed (n. 917) that an interpretation *off(icina/ae)* for **o.f.f.** is doubly problematic: first, it ignores the word-dividers, and second, it requires an unexpected (for this period) geminate spelling *-ff-*. To remedy these problems, Wachter suggests interpreting along the lines of *O(vi) f(ili) f(iglinā) sum.*

4.2.c Wachter's points are well-taken, but his solution introduces difficulties of its own. The most obvious is the new artisan "L. Canoleios O. f.": by far the best-represented artisan of Cales ware is in fact "L. Canoleios L. f.",[7] and there is no other evidence for a second L. Canoleios.

4.3.d below for another such erroneous transcription of N in this set, and **4.7.b** for another elsewhere); E and F are cursive (cf. **15.1.b-c**).

[4] To the best of my knowledge, there is no published photograph of this inscription.

[5] CIL p. 721; similarly Warmington, cf. his n. 4, comparing *officina* in the rare sense "process of manufacture", as at Plin. *Nat.* 11.2.

[6] CIL p. 885, Pagenstecher, Degrassi, Agostiniani.

[7] Thus CIL 406b **L.Canoleios.L.f.fecit.Calenos** et al., see esp. Pagenstecher 152ff. on "Die Fabriken von Cales".

It would be preferable to assume that **L Canolei** is indeed "L. Canoleios L. f.", and that therefore the sequence **o.f.f.** abbreviates three words in a phrase ending with **sum**, assuming the word-dividers are to be completely trusted (more on this point below).

The second problem is a syntactic/phraseological one, and is shared (in one form or another) by the traditional analyses as well. The elliptical expression with two genitives dependent on an implied term (*L. Canolei off(icinae) sum* "I am (a product) of the workshop of L.C.") is syntactically unappealing, as is Wachter's ablative of source (*O(vi) f(ili) f(iglinā) sum*); and the CIL/Warmington version *L. Canolei off(icina) sum* "I am the workmanship of L.C." requires a rare (and perhaps late) sense of *officina*. Moreover, none of these interpretations provides an expression corresponding in any obvious way to the remarkably limited schemata described by Agostiniani in his comprehensive study of such "tituli loquentes" (*Iscriz. parlanti*). Even if the precise phrasing cannot be made to conform to any of the standard patterns for such inscriptions, one should at least be able to motivate it in a relatively natural way, on the basis of the few existing formulae.[8]

4.2.d In view of the above considerations, a more natural solution might begin with a statement like *(ego = patera,* or *forma paterae)* ... **f(acta).sum**, i.e. a passive version of the standard active formula 'X me fecit'; if so, the preceding sequence would be likely to express a locative phrase equivalent to 'in L. Canolei officina'.

A less attractive alternative could be based on the well-attested phrase *opus figlinum* (e.g. Plin. *Nat.* 31.11), which might suggest **L Canolei.o(pus).f(iglinum).f(actum).sum**, cf. *(opus) figl(inum)* with genitive in CIL 2351 **figl.L.Tetti.Balbi**. While the passive **f(actum). sum** could be interpreted (in terms of Agostiniani's formulae) as above, the genitive expression is reminiscent of the other main class of formulae (of the general type '[gen.] sum'), except that these generally express the object's possessor, and not the artisan.

---

[8] Significantly, despite Agostiniani's inclusion of this inscription in his corpus, it is nowhere to be found in his structural analyses, where most other such inscriptions are appropriately catalogued according to their format.

4.2.e There are potentially interesting comparanda from Oscan that have been noticed only cursorily in terms of Cales ware, and not at all in terms of CIL 2489, but which may assist in choosing between these options and in specifying certain details of the analysis. Or more accurately: the Oscan and Latin inscriptions are mutually illuminating, since the Oscan texts have unresolved problems of their own which may become clearer when viewed in comparison with this Campanian Latin text.

Three black-glazed ornamented vessels (hence not unlike Cales ware), found not far from Capua (one in Suessula, the other two in Teano), were evidently made in the same workshop, and have been dated by Vetter to approximately 300 B.C. (note the absence of **í** and **ú** in the inscriptions);[9] they bear the following texts (Ve 124a-c):[10]

Ve 124a **minis:beriis:anei:upsatuh:sent:tiianei:**
Ve 124b **vibieisen:beriieis:anei:upsatuh:sent:tiianei:**
Ve 124c **beriiumen:anei:upsatuh:sent:tiianei:**

We have here two artisans "Minius Berius" (124a) and "Vibius Berius" (124b), perhaps brothers, and presumably the "Berii" referred to simply by a gen. pl. in 124c.[11] Note first that a correspondent to the final locative expression **tiianei** 'Teani', correlated with the verb 'make', is well represented in Latin Cales ware inscriptions (in the form loc. pl. **Calebus**, or abbreviation **Caleb**), beside the other common method using the nom. adj. **Calenos** (CIL 406f,i,k,q,r **L.Canoleios.L.f.fecit.Calenos** etc.):

CIL 412a **Retus.Gabinio.C.s.Calebus.fec.te**
412b **[R]etus.Gabinius.C.s | Calebus.fecit**
412c **Retus.Gabinio.C.s.Calebus.fecit.e**
416 **K.Serponio.Caleb.fece.veqo.Esqelino.C()s.**[12]

---

[9] Similarly Lejeune, *Anthrop. osque* 18, and P. Poccetti, in his detailed study of these texts, "Eine Spur des saturnischen Verses im Oskischen", *Glotta* 61 (1983) 207ff. (208 for the dating), hereafter cited as "Saturn.".

[10] Buck *O-U Gramm.* p. 368 (correcting his inscription 44), Bottiglioni *Manuale* 24-6, Pisani *Lingue* 19a-c.

[11] On this plural usage see Lejeune *Anthrop. osque* 39. (I return to the problem of the case discrepancy — nom. in Ve 124a, gen. in the other two — at **4.2.h** below.)

[12] The general comparison with Cales ware format is noted by Poccetti "Saturn." 209.

Note further the initial genitives (at least in Ve 124b,c), cf. CIL 2489 **L Canolei**. To anticipate somewhat, I suggest that the Oscan sequence "(gen.) + **upsatuh:sent**" supports the interpretation proposed above "**L Canolei + f(act-).sum**".[13] The most serious difficulty, then, is the precise interpretation of the genitive, which in turn depends on the intervening (Osc.) **anei** and (Lat.) **o.f.** (if that is the correct reading), which might well be semantically parallel.

4.2.f Very little about Osc. **anei** is clear beyond its loc. sg. form, but this fact is of some importance. Buck, Vetter and Bottiglioni follow Ribezzo's interpretation of **anei** (*RIGI* 8 [1924] 87) as a form identical to Lat. *ānus* 'ring', but here meaning a '(potter's) wheel'. According to Ribezzo, the locative is to be construed with the postposition **-en** in Ve 124b,c, thus the objects have been made 'on the wheel' of Vibius Berius/the Berii. But this is explicitly rejected by Buck (without explanation), who takes **anei** only with **upsatuh:sent**, i.e. the objects have been 'wheel-made', thereby requiring an elliptical expression for the initial locative **-en**: 'In (officina) Vibii Berii/Beriorum'. This latter analysis appears in Vetter and Bottiglioni, who register some doubt only about the meaning of **anei**.

This interpretation, nevertheless, seems to me problematic. To begin with, there is no parallel in Oscan (or, for that matter, in Umbrian) for such an elliptical usage of **-en** (although, to be sure, one could allow for such a license in a relatively compressed space). In contrast, there is no difficulty with **-en** and locative beside the plain locative in **tiianei**: locative with *-en*, although rare, is evidently expanding in Oscan at the expense of the plain locative (thus Ve 2.25 [Tab. Bant.] *ex<.>aiscen.ligis* 'hisce in legibus', note also the double postposition in Ve 147.1-2 [Tab. Agn.] **húrtín. | Kerríín** 'in luco Cereali'), while the plain locative might itself be expected to be retained precisely in a place-name. Moreover, it seems unlikely that a particular piece (or rather a set, or "service", as Ribezzo plausibly interpreted the nom. pl. of **opsatuh:sent**) should need to be

[13] Despite Pisani (and others), **upsatuh** is more likely nom. pl. masc., not neut. (for this sandhi-treatment of *-us* see Buck *O-U Gramm.* p. 75).

specified as 'wheel-made', even if one grants that such an expression would be expressed with a locative phrase 'on a wheel' (and not, say, an instrumental ablative). On balance, then, it seems preferable to take **anei** (in Ve 124b,c) with the preceding **-en**, according to Ribezzo's original interpretation, although the meaning 'wheel' remains somewhat difficult.

Pisani's interpretation is syntactically similar, but he offers an entirely different etymology for **anei**, which nevertheless cannot be correct: even if, as Pisani believes, Ved. *ukhá-/ukhā́-* 'pot, cauldron' and Go. *aúhns* 'oven' reflect zero grade versions (**ukh-o-*, **ukh-no-*) of a "long-diphthong" stem seen in Lat. *aul(l)a* 'pot', *auxilla* 'olla parvula (P.F. 23.8 L)',[14] no regular mechanisms, phonological or morphological, will produce therefrom the **ākhno-* to which Pisani must appeal in order to explain Osc. **an-**. His *contextual* interpretation of the form, however, is surely the most appealing, i.e. 'In Vibii Berii/Beriorum figulina'. Whatever the correct etymological analysis of **anei**, then, it is most naturally taken as a bona fide locative, expressing something like 'in the workshop (of Vibius Berius/the Berii)'.[15]

4.2.g These considerations, applied to CIL 2489, suggest that the initial genitive **L Canolei** should depend in a natural way on the following sequence **o.f.**, which in turn might represent a locative expression meaning something like 'in the workshop' (cf. already **4.2.d** above). An attractive solution can be obtained, then, by reading **o(ficinai).f(iglinorum)** or **f(igulorum)**, with loc. sg. **o(ficinai)** (followed by gen. pl., in accord with the normal construction with *officīna*).[16] Bearing in mind the actual uncertainty about the presence of each of the interpuncts in the reported transcription **o.f.f.** (cf. **4.2.a**, **4.2.c** above), the simpler phrase **L**

---

[14] On these comparisons see now Mayrhofer *EWAia* I.3 210 s.v. *ukhá-* and Schrijver *Laryngeals* 47.

[15] On the meaning 'officina, fabrica' for **anei** see also Poccetti "Saturn." 212, emphasizing the phraseological parallel between the locatives **anei ... Tiianei**. Ribezzo's connection with Lat. *ānus* (on which see now Schrijver op. cit. 53) could be salvaged by claiming that an original meaning 'circle' developed in the derived sense of 'circle of (like-minded, like-performing) followers', hence 'work group' or the like, cf. Russ. *kružok*, Lat. *corōna* etc.

[16] E.g. *armorum officinas* (Caes. *B.C.* 1.34.5, Cic. *Phil.* 7.4.13), *tinguentium officinae* (Plin. *Nat.* 9.133), *in aerariorum officinis* (ibid. 16.23), *in tonstrinarum officinis* (ibid. 36.165), *falsorum commentariorum et chirographorum officina* (Cic. *Phil.* 2.14.35), etc.

Canolei.of(icinai), which would eliminate the double genitive construction, might also be possible, if not preferable.[17]

Thus, with regard to the Oscan series: apart from the person difference in the verb, and the absence of a final locative in the Latin inscription (but cf. **4.2.e** above on such locatives in other examples of Cales ware), these approximately contemporaneous Campanian pieces would bear inscriptions with essentially the same structure:

Lat.: **L Canolei.of(icinai).f(acta).sum**[18]
'I was made / in the (potters'? pottery?) workshop of L. Canoleius / [in Cales]'

cf. Osc.: '(The dishes) were made / in the workshop of V. Berius (the Berii) / in Teanum'

If this is correct, the locative **o(ficinai)** (or **of(icinai)**) is noteworthy. Not much later than this time, the locative as such is moribund in literary Latin. While a late third-century or early second-century locative of this sort could in theory be simply a syntactic archaism, such a form could also be explained as a kind of syntactic borrowing, of a relatively trivial sort (i.e. the borrowing of a habit of case-usage), reflecting a somewhat more widespread use (or retention) of the locative in ("working-class?") Latin as spoken in Oscan territory, associated with the presence of this feature in Oscan.

4.2.h The strong resemblance between these Latin and Oscan vessel inscriptions from Campania may shed some light, finally, on the remaining problem shown by the Oscan set, namely the case-discrepancy between the first (Ve 124a), which appears to have a nom. sg. **minis:beriis** 'Minius Berius', and the genitives of the other two. Pisani (*Lingue* ad loc.) takes **minis:beriis** as "una scrittura inesatta per **-eis -ieis**", thereby aligning it with the gen. forms of the other two. But this seems highly improbable. Apart from the sandhi-treatment of **upsatuh** (which has a good parallel in

[17] Cf. **of = of(ficina)** *AE* (1987) 166.
[18] Or **o(fic-).f(ig-)**, cf. above.

Ve 102 **púiieh.súm**, cf. n. 13 above), there is no other case of a "scrittura inesatta" in this set; and it is suspicious, moreover, that the two examples with genitive both have the locative particle *-en* (**vibieisen, beriiumen**), which is absent in the first. In short, **minis:beriis** is transparently a nom. sg., and should be explained as such.

Indeed, the other Oscan potter-inscriptions generally show nom. sg. of the potter's name; but insofar as these are seals (cf. Lejeune *Anthrop. osque* 17ff.), they are not strictly comparable to this more extended format. It is striking, however, that in the Latin Cales ware inscriptions, as already noted, the most common pattern is precisely 'X [nom.] fecit', while the genitive *cum* locative phraseology of CIL 2489 is altogether unique. It seems not impossible, then, that the engraver began with nom. **minis:beriis** as if to write **minis:beriis** (scil. **upsed**), according to the active version of the formula typical for a single item, as in (Campanian Lat.) 'L. Canoleios fecit', Osc. *X úpsed*, etc. (see Poccetti "Saturn." 210 on this pattern). But the existence of a *set* of vessels[19] required a switch to the passive plural **upsatuh:sent** (as in the other two as well), and the opening nominative was left uncorrected.[20] The locative **anei** shows that the nominative is essentially anomalous, while Poccetti's phraseological analysis (with major break after **anei**) argues against an elliptical interpretation of the sort 'Minius Berius (fecit). In (eius) figulina facti sunt Teani'.[21] It seems to me, then, that Poccetti's attempts to find some further significance in the nominative expression (as opposed to the genitive ones)[22] are unnecessary.

---

[19] Or, as Poccetti prefers (211), general reference to "alle Erzeugnisse der *Berii*-Werkstatt".

[20] Cf. similar lapses well-attested in "tituli loquentes", arising from interference between 'Ego [= artisan] feci' and 'X [= artisan] me [= object] fecit', e.g. E. Locr. (Hales, 6th c.) Διακριος μ' ἐποιϝεσα [sic] (Duhoux *Introduction* 34, p. 87f.).

[21] Similarly Ribezzo (loc. cit.): **minis:beriis** "proletti̇co ed independente da tutto il costrutto".

[22] "Saturn." 211: "die Unterscheidung in der Kasusverwendung ... entweder dem juristischen Verhältnis zum Firmeninhaber oder einer Verteilung der Arbeit innherhalb der Werkstatt zuzuschrieben ist", among other hypotheses.

4.3 *Notes on the Paleography of Campanian Inscriptions*

4.3.a In view of the above comparison with Oscan phraseology, including the possible reflection of the frequency of independent locatives in Oscan, we are led to reconsider certain paleographical features found in Cales ware (and in other Campanian inscriptions), with regard to the question of "Oscan influence" (cf. **4.1**).

As with the grammatical elements cited in **4.1.a**, Wachter also rejects Oscan influence for certain orthographic features attested in Cales ware (*Altlat. Inschr.* §184b): "Nicht oskisch ist die Schrift (gewisse linksläufige einzelne Buchstaben und ganze Inschriften rühren davon her, dass der Hersteller beim Modellieren der Form mit der dafür nötigen spiegelschriftlichen Schreibweise Mühe hatte)". But the attestation patterns of these right-to-left letters and inscriptions[23] do not support this analysis, and there is further evidence that can be brought to bear on the question as well. (It will be convenient, for the following discussion, to compare early examples of native Oscan lettering found in or near Campania, especially those roughly contemporaneous with Cales ware, as in the Capuan *iúvila*-inscriptions,[24] or the Agnone Tablet.[25])

4.3.b For individual reversed letters in otherwise left-to-right inscriptions, Wachter cites, among others, the left-facing S's in CIL 416.[26] But this is a regular feature of this inscription: the text contains three S's, and each one is left-facing. Moreover, the first (in **Serponio**) is of the angular three-stroke type, while the second two (in **Esqelino** and the final abbreviation **s.**) are of the curved type — i.e., they are identical to the two types in use in the Oscan alphabet. Under these circumstances, it seems highly unlikely that these forms of S are here due to the production

---

[23] Cited by Wachter at n. 918, cf. also **4.3.b**.

[24] Ve 74-94, cf. also Heurgon *Étude*, and esp. Franchi de Bellis *Iovile* (with extensive photographic documentation); two examples in Morandi *Epigrafia* (nos. 25 and 26; photographs Tavv. 21.3 and 22.1).

[25] Ve 147; good photographs of both sides of the inscription are now conveniently accessible in Bonfante *Etruscan* 55 and Morandi *Epigrafia* Tav. 24.

[26] In the discussions of paleography that follow, all cited Latin inscriptions belong to the set of Campanian "Cales ware", unless otherwise noted.

difficulties hypothesized by Wachter. Moreover, the "notdürftig korrigierten ⊥ (L)" Wachter cites (CIL 4051, 409c) are not isolated: more significant (since they involve the older angled form) are the two other instances of reversed L (not mentioned by Wachter) in the series of **K.Atilio** inscriptions collected in CIL 405, namely 405f and 405i.[27]

As for the inscriptions entirely composed in a right-to-left direction (CIL 411b,c and 2492): this is again not an isolated fact related to the particular format of these productions, but is comparable with other instances of the same feature (in roughly the same area) on vessels where the production considerations Wachter suggests are less pertinent; note, for example, the series of amphora-handle inscriptions CIL 2878a-c (p. 887) from Minturnae (not far to the north), in which 2878a reads left-to-right, but 2878b and 2878c read right-to-left.[28] Also from Minturnae, note the right-to-left pottery shop identifications CIL 2880.6,7,9.

4.3.c Several other isolated facts of lettering and punctuation cannot be ascribed to the production difficulties Wachter assumes, but are more naturally taken to reflect habits associated with Oscan writing.

The most striking such feature concerns the form of "K": in many of the inscriptions collected under CIL 405, all with the general form **K.Atilio** (cf. **4.3.b**), the "K" is written quite clearly as if it consisted of a sequence of the two letters "IC" (thus 405c,d,e,f,[29] and the new examples 405m,n[30]). This somewhat unusual early stylization, for which no explanation, to my knowledge, has been offered, has a simple correspondent in both Oscan and Umbrian: documents in the native alphabets not uncommonly write "K" in precisely this fashion (except right-to-left), with the vertical stroke visibly separated from the following portion, which is

---

[27] I return to other features found in the CIL 405 series in **4.3.c** and **4.3.e** below.

[28] A problem with the actual reading of these inscriptions is discussed at **4.3.f** below.

[29] Cf. CIL (p. 412) ad loc.: "IC littera K disiuncta"; see, for example, the photograph of CIL 405c in CIL I^2 (fasc. 4) tab. 11 fig. 3, or of 405d in Degrassi *Imagines* 371.

[30] P. 884f.; here note Krummrey's comment rejecting the original editor's "C in initio", in favor of ".IC. scil. *K*". On a further feature of these inscriptions involving punctuation, see **4.3.e** below.

itself identical to the usual (most often angled) form of "C"/"G" in the native alphabets.[31]

4.3.d A speculative (but suggestive) case concerning another letter form involves CIL 2488, which may be among the oldest of the Cales ware inscriptions (cf. Degrassi *ILLRP* 1219 ad loc. [= CIL p. 885]: "non multo post a. 278"). The inscription is traditionally read **L.Anici.feci**. The CIL rendering with upright N (p. 721) is simply incorrect: study of the photograph[32] shows what at first appears to be a clear inclined N. But close inspection shows (a) a relatively large space separating the A from the alleged N, and (b) two possible stroke traces not unlike an inverted V preceding the N, such that Bieńkowski's reading **Amici**, despite the rarity of this gentilicium (vis-à-vis the common *Anicius*),[33] seems to me still possible. If so, the M would be a five-stroke (left-to-right) M, whose otherwise unusually late appearance here could be explained on the basis of the similar native Oscan (except right-to-left) five-stroke M in regular use at this time.[34]

4.3.e The paleographic features reminiscent of Oscan include not only letter forms, but also punctuation. It is a remarkable fact, which I have not seen noted elsewhere, that Oscan inscriptions (in both alphabets) not uncommonly make use of a *line-final punct,* following both complete words and abbreviations — a practice (especially in the first case) generally alien to Roman Latin inscriptions. In addition to the Agnone

---

[31] This technique is quite clear (although not entirely consistent) on the Agnone Tablet, which has many examples of "K disiuncta". It is evident as well, closer to Cales, in the *iúvila*-inscriptions: note, for example, the K of **kluvatiium** in Ve 77B.2 (photographs in Heurgon *Étude* plate II.1, Franchi de Bellis *Iovile* tab. 2), with not only "K disiuncta", but a relatively smooth version of the "C" portion, quite similar to the "IC" in the Latin **K.Atilio** series (for further examples see Franchi de Bellis tabb. 3, 11, 19). On the two forms of "K disiuncta" (i.e. both curved and angular) in Umbrian, see Prosdocimi *Tavole* 140 (and the table on 139).

[32] Pagenstecher *Reliefkeramik* 41b (p. 44 fig. 21).

[33] *Amicius:* Schulze *Eigennamen* 121, cf. also **L.Amio** (CIL 1731, Beneventum), **L.Amius** (1755, Aesernia).

[34] Note also, in this connection, the archaic inscription CIL 2491 (probably contemporary with 2488), with the odd sequence "NATMS". It has often been suggested, with some plausibility, that this reflects something like **N.Atilio**; but the final "-MS" seems to point rather to an Oscan-style nom. sg. **Atilis**.

Tablet, where this feature is perfectly regular, numerous isolated instances are quotable from both Vetter[35] and Poccetti.[36] The practice is also attested (as one might expect) in Paelignian, at least to judge from standard transcriptions;[37] indeed, this fact has certain interesting consequences that cannot be pursued in detail here.[38] It is particularly interesting to note, moreover, that this practice is the norm in the Umbrian native alphabet, but never found in the parts of the Iguvine Tables written with Latin alphabet (cf. Hoenigswald "Punteggiatura" 215 n. 86, Prosdocimi *Tavole* 142). Nevertheless, this feature appears with marked frequency in both older and more recent Latin inscriptions from Marsian territory and Campania;[39] apart from line-final punctuation after names and (especially) onomastic and titular abbreviations (**f.**, **mag.** etc.), this feature is not well-represented in Roman inscriptions (or in Latium generally), where "multi-line" examples are especially rare and seem restricted to late Republican times (see e.g. CIL 3004).[40]

---

[35] In the (Capuan) *iúvila*-inscriptions alone: Ve 81.6, 81.7, 83A.1, 84.4, 85.4, 86.10, 87.1, 87.4, 87.6, 87.8, 88B.2, 91.4, 91.5, 94A.1, 94B.1, plus several new examples appearing in Franchi de Bellis *Iovile* : 11.2 (cf. Ve 75), 14.1, 14.2 (cf. Ve 89B), 19.3, 19.5 (cf. Ve 83).

[36] For Campanian examples see Pocc 107, 119, 134, 137, 138.

[37] Ve 209.2, 215i, 215p, Pocc 209, 213, 216.1, 217, CIL 3259.1,2, 3260.1; this feature is regularly ignored in the earlier transcriptions by von Planta and Conway (see also next fn.).

[38] I refer to the Paelignian texts derived from copies found in Renaissance manuscripts, Ve 202 and 203: note especially the three occurrences (out of six lines) in 202. If the manuscript accurately reflects this typically Oscan/Paelignian feature, the internal puncts in the notorious form *sest.a.plens,* which are generally dismissed as errors so as to identify the form with Volsc. *sistiatiens* (Ve 222; for discussion see R. Wallace, *Glotta* 63 [1985] 93ff.), can perhaps not be so casually ignored (or converted into other characters: *sest.a-* > *sestia-* etc.; cf. also the internal punctuation of Osc. **mamert.tiaiş** Ve 86, **mame.rttiaiş** Ve 84, on which see Franchi de Bellis *Iovile* 177). It should be noted, however, that the standard transcriptions of Paelignian reflect considerable confusion with respect to this feature, and deserve further study in this light: thus CIL 3259 and Jiménez Zamudio *Peligno* 45 both transcribe **Pa.Petroni. | Pom.f.bea.** for the first two lines (correctly, see the photo, CIL I^2 [fasc. 4] tab. 86 fig. 3), vs. Pocc 206 and Pisani *Lingue* 49B with no line-final punctuation. (Such confusion is further compounded by Jiménez Zamudio's practice of closing many of his transcriptions with a period.)

[39] From CIL I^2 (fasc. 1) alone: 386.2, 389.1, 391.2 (Marsian territory); 400 (bis; see further **12.2.c** [with n. 17]), 1580, 1586.2, 1588 (4x out of 6 lines), 1591.3, 1592.4, 1593.2, 1596.5, 1597 (bis), 1604, 1605 (bis), 1618, 1623, 1633, 1635, 1637 (4x out of 7 lines) (Campania); cf. also **13.3.b** n. 10 for CIL 388.

[40] See also **4.3.f** below on the lantern inscriptions CIL 537 and 538; on line-end punctuation as essentially unsystematic: e.g. Gordon and Gordon *Contributions* 183.

In view of this practice, then, it may not be coincidental that one of the inscriptions in the **K.Atilio** series showing both "K disiuncta" and reversed (angled) L also shows a final punct (as well as an initial one), namely CIL 405f (**.IC.ATI ⅂IO.**). Indeed, the odd opening punct so commonly found in this set (besides 405f, also 405a,c,d,e,n) is perhaps to be explained as a kind of Latinization of this Oscoid closing-punct format, with 405f (here both opening and closing punct) as a kind of transitional archaism in this process (here also, as noted, both "K disiuncta" and reversed [angled] L).

In this connection, note further Krummrey's suggestion (CIL p. 885) concerning the reading of CIL 2490a (from the same area): originally read as **Gabinio** (CIL p. 721), then as **H.A[...]ini** (Degrassi *Imagines* 374a,b), it may conclude (as Krummrey notes) rather with **-ini.** (with final punct).

4.3.f These facts concerning line-final punctuation have a number of applications beyond the Cales ware inscriptions themselves, as in the problem concerning the reading of the Minturnae amphora-handle series referred to above (**4.3.b**). The last character of CIL 2878a (left-to-right) appears to be a very small O (at the mid-point of the letter space), which could be taken as a punct (thus either **[V]alerio** or **[V]aleri.**), and the corresponding character in 2878b and 2878c occupies a larger portion of the letter space (much like 2490a, **4.3.e** above), thereby compounding the ambiguity: hence Lake (the original editor) preferred *"Valerio(s)'*, Degrassi preferred *"Valeri"*, and Krummrey (CIL p. 887) tentatively suggests *"Valeri o(fficina)"*; in view of the above observations, I suggest that **Valeri.** (with final punct) is an attractive possibility, if not actually preferable, at least for 2878a. The same feature is also attested on two Esquiline lamps (CIL 537 **P.Ven.**, 538 **Ti.Veturi.**; see the facsimiles in CIL), where the correlation with cursive E in both cases is noteworthy (cf. also **5.3.e** below for another vessel-inscription with line-final punct on an object found in Rome, but with suspected non-Roman provenience for independent reasons).

4.3.g These facts are also of interest in connection with the "Johns Hopkins" defixiones (CIL 2520, Ernout *Recueil* 140, Gager *Curse Tablets* 240ff.), where this feature is not only frequent (as noted by Fox *Tabellae*

54), but indeed almost regular. Fox argues for Roman provenience (55ff.), largely since the *gens Avonia* (appearing in two of the exemplars of these texts) is most frequently attested in Roman inscriptions. But on the other hand, the *gens Vesonia* (in another exemplar) "is found by far the most frequently in Central Italy" (Fox 55). Together with certain non-urban linguistic features in these texts,[41] as well as the detailed enumeration of body parts typical of other Campanian defixiones, this distinctive feature of punctuation might rather support a Campanian provenience.

Thus one can say that Wachter's assessment ("Nicht oskisch ist die Schrift") is again accurate, *grosso modo,* but serves to obscure certain interesting (if subtle) minor features of orthography and paleography that may well be attributable to Oscan influence. Such features allow us to envision more accurately the complex sociolinguistic patterns likely to be at work in such a place and time, as is only to be expected in comparison with the full range of similar features of orthography and paleography to be examined in more detail in later chapters (cf. **4.1.b** above).

4.4 *CIL 3121 nocerei*

4.4.a The first-century Capuan cippus CIL 3121[42] reads as follows:

Fausti.N.N.
Grani.deliciae.o.h.s.s
N.Granius.Artemo
pater.poseit.rogo.te
v i a t o r . n o l e i
m e . n o c e r e i

Degrassi (in CIL) notes the unexpected **nocerei** in the last line ("forma *nocerei* nova est"), but disagrees with de Franciscis (the original editor),

[41] See Ernout *Recueil* ad loc. on **Avoniaes** (gen. sg.), **quas** (nom. pl.), **polliciarus** (2sg.; on such 2sg. forms see also Nussbaum, "Benuso" 368, and note **fruarus** *AE* [1983] 66), **oriculas**; for **Avoniaes**, cf. **Fisiaes** *AE* (1983) 34, **Noniaes** ibid. 35.
[42] P. 1009, photo tab. 60 fig. 1.

who took the form to be merely a stonecutter's error. In the absence of further explanation by Degrassi, Krummrey adds the following comment: "recte putare videtur H. Solin deponens formatum esse ex studio q. d. *Hyperurbanismus*". Solin's idea is at first sight attractive; if it is correct, then the "hyperurban" deponent *noceor* makes an interesting addition to the ranks — not terribly large — of other such forms.[43]

4.4.b But the situation is perhaps not so simple. It seems distinctly odd for a "hyperurban" form like **nocerei** = *nocērī* (if that is what it is) to be provided with an accusative object **me**: apart from "cognate accusative" expressions (XII Tab. *noxiamve noxit* etc., Bennett *Syntax* 2.198) or (semi-adverbial) expressions with neuter accusative (Plt. *Pseud.* 137 *tibi plus noceas* etc., Bennett ibid. 2.200, 204), accusative government with *noceō* (probably analogical after *laedō* and *necō*, and in some contexts also after βλάπτειν τινά) is a very late development, otherwise not seen until the fourth century A.D. (Chiron, Vegetius, Vulgate, etc.; details in Szantyr *LSuS* 33, Ernout-Thomas *Syntaxe* 19). In contrast, a passive *noceor*, as if from a virtual transitive, is attested earlier — indeed, considerably earlier than (Hofmann-)Szantyr's single citation (Just. 44.4.6) seems to indicate.[44] It may be preferable, then, to view **nocerei** as somehow reflecting a real passive (as opposed to a hyperurban deponent.) It is difficult to decide, however, whether the phrase **nolei.me.nocerei** is an intentional variation ("do not consent to my being harmed") of similar active formulas,[45] or rather a syntactic error, presumably a kind of contamination between (imperat.) *noli mihi nocere* and (1 sg.) *nolo me noceri;* under the latter analysis, the error could either be a "performance" error at the stage of composition, or else could have entered during ordination or engraving, in view of the fact that **nolei** in line 5 (followed by **me**) is positioned directly beneath the phrase-initial 1 sg. **rogo** (followed by **te**) of line 4.

---

[43] See in general Flobert *Déponents* 195-215 for diverse types of "variantes déponentes" in Republican and Imperial Latin.

[44] In addition to the passage from Justinian (*Ofilius putat...non nocituram exceptionem doli mali*), e.g. Vitr. 2.9.14 (*larix...ab carie aut tinea non nocetur*), CIL VI 29947 **quod.si[.]nocueris.noceberis.ab[.]alio**).

[45] CIL 1368 **nolei.violare**, 1596 **ni.violato**, etc.

4.4.c It may be worthwhile to signal, in concluding, an interesting parallel favoring the assumption of an actual passive (whether directly via **nolei.me.nocerei** "do not consent to my being harmed", or an interfering *nolo me noceri,* cf. above). Such an expression would be strikingly similar to Trimalchio's phrasing *permittitis tamen finiri lusum* (Petr. *Sat.* 33.2), which itself is sometimes taken precisely as a passive-for-active lapsus (cf. Boyce *Freedmen* 100), but need be nothing of the kind. The same applies to a series of alleged Petronian hyperurban deponents, namely *rideor* (*qui rideatur alios* 57.3), *delector* (*cum dominam suam delectaretur* 45.7, *nihil nos delectaris?* 64.2), *fastidior* (*ne me putes studia fastiditum* 48.4), *pudeatur* (*non est quod illum pudeatur* 47.4), *somnior* (*hic ... aedes non somniatur* 74.14), cf. Smith *Cena* 222 and Boyce *Freedmen* 52. But these have all been more convincingly analyzed by Flobert (*Déponents* 210ff., 195 for *pudeatur*) as actual passives, in some cases also found (mostly later) in other authors. To these can be added, moreover, the interesting example CIL 1603 **te.decuit.floreri** (from a sepulchral inscription in "Lucretian" hexameters, also from Capua), in which the standard correction to **florer<e>**[46] is unnecessary (cf. Flobert *Déponents* 197f.).[47] In view of the prominent attestation of such forms among Petronius' freedmen, together with Capuan **nocerei** and **floreri**, one wonders whether this spread of new passives is to some extent not merely "hyperurban" (or non-urban) but more specifically a Campanian feature.

---

[46] Thus Degrassi *ILLRP* 984, Warmington *Remains* p. 22, cf. already Garrucci *Sylloge* 1574 (printed simply as **florere**); more recently e.g. Wingo *Punctuation* 148, q.v. for the metrical space punctuation (cf. **16.2.b** below) and the verse-initial "capitalizations": carefully-executed features that make an error still more unlikely. (The second "error" Wingo alleges — namely **iventa** — is simply an instance of a normal "economical" spelling (cf. CIL 2940 **Iventius** etc.), for which see Wachter *Altlat. Inschr.* §62k.)

[47] With line 2 in particular (**Eheu.heu.Taracei.ut.acerbo.es.deditus.fato**) and the entire sentimental composition in general, compare Trimalchio's similar poem *"Eheu nos miseros ..."* (Petr. *Sat.* 34.10).

4.5 *On Some Monophthongizations of *ai and *au in Inscriptions from Umbria and the North Coastal Area (CIL 3292a, 3374, 1899)*

4.5.a Even Wachter, despite his pervasive and thoroughgoing skepticism concerning dialectal or other non-urban influences (cf. **4.1.a** above), admits that the inconsistent monophthongization of **ai* and **au* seen in Latin inscriptions from Umbria and the north coastal area results from a "weak substratum influence" (*Altlat. Inschr.* §216i, cf. §218c), a view that is generally accepted and widely discussed.[48] The early examples cited, however, are extremely limited, being restricted to a few familiar forms from CIL 366 (Lex Spolet.),[49] and from the *cippi Pisaurenses*.[50] There is some interest, then, in supplementing, if possible, this relatively meager material. The following examples, while partly uncertain and in most cases not necessarily earlier than the mid-second century, may still provide evidence of potential interest for the history of monophthongization in this area, which may be somewhat more complex than is generally thought.[51]

4.5.b *CIL 3292a*. Among later inscriptions from this area, the joined altar fragments CIL 3292a from Hadria,[52] first published in 1982, present two forms of some interest. The inscription reads:

Menerve..L..Rutilacius[..[53]]M..f..prator..is[(dem..prob)][54]

---

[48] Recent treatments of interest, from various perspectives, include Blümel *Untersuch.* 11ff., 28f., 44f., X. Mignot in *Étrennes Lejeune* 130f., Coleman "Central Ital." passim, Meiser "Pälignisch" 113ff., Joseph and Wallace "Patois" 165, 171.

[49] Here **cedito** (beside **caiditod**) and **cedre**.

[50] CIL 376 **Cesula** and **Diane**, 379 **Pola** vs. 378 **Pisaurese**; on the episodic character of **Diane** for this region see Cresci Marrone-Mennella *Pisaurum* 122 (ad loc.), and note Peruzzi's doubts about the value of the latter pair for determining the local treatment of **au* (*Pesaro* 39).

[51] For a particularly detailed discussion, including Romance developments, see Sturtevant *Pronunciation* 125ff. (**ai*), 129ff. (**au*).

[52] P. 1050, photo tab. 139 fig. 1-2.

[53] The existence of punctuation here does not appear to be certain.

[54] The interpuncts are of the unusual double-horizontal type, found also in the similar (but perhaps slightly later) fragment CIL 3292b **M..Aninius..M..f..[** (cf. **16.2.c**). The letter forms are consistent with Buonocore's early-second-century dating: note especially

Apart from the new **Rutilacius** (beside well-attested *Rutilius*), the dative in *-e* **Menerve** can be added to the hitherto isolated (for this region) **Diane** of CIL 376; geographically, however, **Menerve** is not far removed from many of the other examples of dat. **-e** (see the listing in Blümel *Untersuch.* 44), a phenomenon which Blümel (45) takes to have a Marsian epicenter.[55]

Still more surprising is the unique spelling **prator** for *praetor*, cf. non-urban **pretod** in CIL 365 ("Faliscan-Latin", cf. also Lucil. 1146 Krenkel = 1130 Marx *Cecilius pretor ne rusticus fiat*), and further (despite Schulze *Eigennamen* 350) perhaps CIL 1026 **Cacilia** (bis, olla ex vin. S. Caes., cf. Wachter *Altlat. Inschr.* n. 1051). It may, of course, be nothing but a crude mistake; but the simple formulaic nature of the text, together with the generally even and polished cutting style otherwise evident, do not favor such an assumption. If the form is real, it provides interesting evidence about the pronunciation of "medial *-ae-*" at this time and place, especially in view of its coupling with a "final *-ae*" spelled **-e**.

4.5.c *CIL 3374.* The first-century altar inscription from Spoleto CIL 3374[56] reads as follows:

[-----]rius
Philoda
Herculei
Primigenio
ed.d.l.m.

Aside from providing the first attestation of "Hercules Primigenius" (see Wachter *Altlat. Inschr.* §84i with n. 599, Dumézil *Mariages* 311ff.), this

inclined M and open square P, although N is upright; moreover, despite the CIL rendering with perpendicular L, the photographs seem to show a slight rise for the bottom strokes of both L's, and despite the A's with horizontal cross-strokes recorded in CIL for both **Rutilacius** and **prator**, the cross-stroke of the A of **prator** seems to show a slight rise.

[55] Another "border zone" case of interest in this connection (here involving Etruria/Umbria) is the roughly contemporaneous CIL 1998 (ca. mid-2nd c.) from Orvieto, with the sequence **Taniae.Petronie** (cf. **12.3.a-b** on the ligature).

[56] P. 1079; Degrassi *ILLRP* 155a (*Imagines* 76).

inscription presents a problem of potential interest for the history of monophthongization in this area. While the first line can readily be completed (e.g. CIL and others **[-.Ruf]rius**) and the second line expanded as **Philoda(mus)**, the initial member of the abbreviated phrase in line 5 has no easy solution. This would appear, at first sight, to be a variant of the frequent formula *donum dedit libens merito*, very similar to its common abbreviated form **d.d.l.m**: hence the resolution **[d]ed(it).d(onum). l(ibens).m(erito)** preferred in CIL, and apparently also by Wachter (n. 621, where this inscription is listed among others reflecting the banal formula just mentioned). The word order *dedit donum*, although unusual, can be paralleled;[57] more troubling are the facts that, first of all, this line is indented (cf. the transcription above, as well as the discussion of such patterns in **3.3.c-f**); second, to judge from the photograph, the space before **ed** is intact (unlike the broken area in line 1), and (although somewhat worn) bears no clear trace of a missing character. This is all the more surprising in that the remaining letters all appear to be quite deeply cut.

It seems preferable, then, to accept in principle a variant of Rambaldi's original suggestion **[a]ed(iculam).d(icavit)**, more recently seconded by J. Champeaux,[58] and slightly varied in Degrassi's *ILLRP* version **[a]ed(em).d(edit)**.[59] If we assume that there was in fact no letter preceding **ed**, then we have in this **ed(em)** or **ed(iculam)** a further (and relatively late) instance of a non-final monophthongized **e-** < *ae-*, cf. the geographically proximate CIL 366 (Lex Spolet.) **cedre, cedito.**

4.5.d *CIL 1899*. CIL 1899[60] reads as follows:

]lenixTxfxPxBabidenixCxfxPxVetedixTxfxfocxdexqų[

---

[57] E.g. CIL 2645 (also from Spoleto) **[He]rcolei.sacrum | [--]esius.C.l.Tertiu[s] | [decu]ma.facta[.]dedit | [do]num.meret[o].**

[58] *Latomus* 34 (1975) 955 n. 95.

[59] Indeed, the verb can just as well be **d(at)/d(edit)** or **d(edicat)/d(edicavit)**; cf. (for *aediculam*) CIL 1549 **aediculam...dant**, 1762 **aediculam...dedicavit**, and (for *aedem*) 9.6 **dedet...aide.mereto[d]**, 626 **aedem...dedicat.**

[60] Pp. 669, 1051; Ornano grande (earlier "Ornani"), ager Hadrianus.

Although N is apparently upright, the P, according to Monunsen (cf. CIL IX 5048), is "aperta et paene quadrata"; a second-century date is thus possible, if not probable (cf. also the use of **-i** vs. **-ius**, as in CIL 1898 from Picenum, and the rare cross-hatch word-dividers). As for the unclear phrase **foc.de.qu̧[**, Mommsen observes that **foc** is not likely to represent a cognomen,[61] and that a form of *focus* seems to be inappropriate; he therefore conjectures that the three magistrates in question might have constructed *fauc(es)* (i.e. an 'entrance-way' or 'passage' ?) of some sort. The context cannot of course be reconstructed, but the phrasing with **de.qu̧[** seems consistent with a specification of location, to judge from possible parallels of the sort CIL 1529 **porticum.qua | in.arcem.eitur**, or (with **de**) 2197 **de.via.Pos[t]umia.in | forum.pequarium** and (somewhat differently) 638 **primus.fecei.ut.de.agro.poplico | aratoribus.cederent.paastores.**

Indeed, the Romance descendants of *"faucēs"* presuppose rather a monophthongized **fōcem/*fōcēs,* itself well-attested in literary sources,[62] with an adjectival **fōcālis* guaranteed at least for the first century B.C., cf. *fōcāle* 'neck-cloth, cravat' (Hor. +), similarly *fōcāneus* 'side-shoot (in the fork of a tree)' (Columella +). Of particular interest for the interpretation of **foc.** is the gloss *foces: ubi latrones insidiantur* (CGL 5.296.15). Thus, while the handbooks typically cite (late literary) *fōcēs* as a suspected case of "dialectal" monophthongization (see e.g. Leumann *LLuF* 72, Sommer-Pfister *Hdbch.* 68f., Ernout *Eléments* 162), Monumsen's interpretation of CIL 1899 **foc.** (if correct) would provide a welcome piece of inscriptional support that has otherwise, to my knowledge, gone virtually unnoted in this connection.[63]

---

[61] Solin and Salomies *Repertorium* 333 list only *Focarius,* cf. Kajanto *Cognomina* 323.

[62] See Ernout-Meillet s.v. *faux* for Isidore's (*Diff.* 2.60) semantic distinction between *fauces* ('angustae fistulae') and *foces* ('per quas vocalis spiritus ... exsiliens sonum emittit'); compare Celsus' distinction in usage between *caulēs* (botanical, 'stalk of a plant') and *cōlēs* (anatomical, 'penis'), discussed by H. von Staden, in *Latin médical* 281 with n. 45.

[63] Only *TLL* 6[1].393.4 (s.v. *faux*): "CORP. IX 5048 ubi **foc.** obscurum".

4.6 *CIL 382*

4.6.a At the conclusion of his treatment of Umbrian, Vetter (240a) addressed three Latin inscriptions from Umbrian territory which in his view showed features attributable to dialectal influence: CIL 1898 (to be treated in Chapter **12** below in a discussion of non-Latin ligatures), 1926 (treated in **4.7** below), and 382,[64] from Massaccio (Picenum). This inscription (on a bronze patera, unfortunately now lost) poses difficult interpretive problems because of the obscure **veheia** of its concluding phrase (evidently the form which led Vetter to cite the inscription, since some scholars, as he notes, take **veheia** to be a "dialectal appellative"):

V.Avilio.V.f.V.Alfieno.Po.f.pagi.veheia

Before appending some observations on another point, it may be noted that the (more or less local) dossier of data potentially relevant for interpreting the phrase **pagi.veheia** should now include the archaic (3rd/2nd c.) fragments CIL 2897a **pagi.fid[** and 2897b **pa[gi.--]**, and perhaps also (ex coni.) 2898 **[pag]i.Vesuini**, all from Ariminum.

4.6.b As noted by Vetter and in CIL (p. 879), the second patronymic appears to read **(Po.)p.**, not **(Po.)f.**, which Vetter, like all other editors, nevertheless took to be a cursive F (cf. cursive F in **Alfieno**, beside three-stroke F in **V.f.**). The paleographic sources of the ambiguity emerge clearly from study of the facsimile (see e.g. CIL p. 407): (1) the engraving technique in question ("litteris punctim exaratis") often leads to difficulties of interpretation, since individual characters may have an insufficient number (or an unorthodox positioning) of dots to achieve unambiguous definition (an analogous case is noted in **4.6.d** below); and (2) the three nearly-contiguous similar characters (i.e. the P of **Po.**, the P or F in question immediately following, and the P beginning the next word **pagi**) all differ in shape: of the clear P's (both "aperta"), the first is

[64] Pp. 407, 739, 879; Wachter *Altlat. Inschr.* §201a, Degrassi *ILLRP* 578, Ve 240a1, Ernout *Recueil* 77, Warmington *Remains* p. 206.

distinctly rounded, while the P of **pagi** is "quadrata", and the ambiguous character between them has a *slanting* short vertical stroke on the right side and very little space at the top between the two strokes (thus ⁝ , vs. the cursive F in **Alfieno**). Under the circumstances, Vetter's interpretation of this character as a cursive F (but with slanted right side, as not infrequently) seems attractive, and may well be correct.

4.6.c Nevertheless, the problem may be part of a broader network of facts, including the following:

(i) The archaic pedestal inscription CIL 3297 (p. 1052), also from Picenum (ager Truentinus, near Sant'Omero), is transcribed in CIL as *"V(ibius) Mum(ius) / C. f.";* but the facsimile there reproduced clearly reads **V.Mum | C.p**, i.e. with "P aperta et quadrata".

(ii) A similar uncertainty surrounds the **f** in CIL 2874a = Ve 224a,b[65] **(Po.)f** or (with final punct) **(Po.)f.**[66] (followed in the next line by **Iovies.puclę[s]**)), from Marruvium, in Marsian territory: although generally restored as (cursive) **f** (cf. consistent cursive E in this inscription, 3x), the right side of the character is damaged, as is the top of the letter space; thus open square P (which is otherwise constant in this inscription, 3x) remains a theoretical possibility, as Wachter notes: "Unsicher ist ferner, ob am Ende der Zeile *f.* steht: Möglich ist nämlich auch *p.*, d.h. dasselbe Wort 'Sohn' wie bei den Göttern in Z. 2".

Even if item (ii) is correctly read with **f** (and not **p**), this last observation of Wachter raises interesting possibilities for (i), together with the problem concerning CIL 382 (as just described), as well as the following fact: the native Umbrian P is precisely the angular type, with slanted short stroke (i.e. ⁀) — that is, it is identical (except for direction) to what Vetter took to be the "slanted" form of cursive F in CIL 382. Although various scenarios are possible, one can easily imagine, for example, local confusions between Umbrian (and also, in part, North Oscan/Paelignian)

---

[65] CIL p. 881; see now also Pocc 222, Letta-D'Amato *Epigrafia* 120 (photo tab. 40), Wachter *Altlat. Inschr.* §188 (with facsimile).

[66] CIL p. 881, following Letta-D'Amato, but see Wachter and the photograph.

angled P and cursive F, sometimes leading to Latin spellings like the "**C.p**" (with open square P) of CIL 3297. However one envisions the confluence and direction of such events, a non-Latin **pukło-*[67] is likely to play some role, at whatever remove, and so would be interesting for the dialectal profile of the area.

4.6.d With all due reserve, it is tempting to adduce, in this connection, a puzzling and hitherto isolated problem of Umbrian paleography, involving, once again, unexpected graphic alternants **p/f**: i.e., the alternation seen in (Tab. Ig.) Ib 3 **kutep** beside (expected) **kutef** (6x), and in the sequence **tref:vitlup:turup** in the next line (Ib 4), cf. (expected) **tref:vitluf:turuf** (Ib 1). To be sure, **kutep** directly precedes **pesnimu**; but the same sandhi explanation easily conjectured for that sequence cannot account for **vitlup:turup** (cf. Prosdocimi *Tavole* 177 ad loc.). The alternation remains obscure, especially since the native Umbrian **f** character bears no relation to any form of P, or to any form of Latin F; theoretically, however, a copy text (or perhaps rather some earlier version of the text) that used "slanted cursive F" (of the type seen in CIL 382) might help account for the appearance of these aberrant P's in the text tradition, although an appeal to such a scenario must remain entirely speculative.

Note finally yet another Umbrian P-/F- ambiguity, in the Umbrian portion of the Umbrian-Latin bilingual CIL 2873 (cf. **3.1.c**), written in the Latin alphabet "litteris punctim incisis" (cf. CIL 382!): the character in question is either a cursive F (whence **Folenia**, cf. consistent cursive E), as generally preferred (thus Meiser and CIL, after Lejeune, *REL* 30 [1952] 98f.), or open square P (whence **Polenia**); see Lejeune for discussion of onomastic parallels for both possibilities.

[67] Cf. the Oscan abbreviation **puk** (Ve 6.9); for Picenum cf. also SPi. *kaúieis : puqloh* (AQ 1).

4.7 *CIL 1926*

4.7.a The fragmentary inscription CIL 1926[68] reflects dialectal features, according to Vetter, in that the forms **magisteri** and **Terebius** show "Sprossvokale vor *r*, wie sie dem Stadtrömischen fremd sind"; for the latter he compares CIL 312 (cipp. Praen.) **Terebuni** (= Ve 479), and for **magisteri** one may compare early Praen. **magistere** (CIL 59).[69] There are, however, several inaccuracies in the presentation of this inscription in CIL I^2 (fasc. 1), as can be seen by inspection of the photograph published in CIL I^2 (fasc. 4); one of these, in turn, leads to a revised reading of some interest for the first word, traditionally read as **magister | i.**[70]

4.7.b Consider first the original CIL representation, reproduced as follows:

Given the broken left edge, together with the apparently consistent use of cursive E (cf. Chapter **15**), Mommsen plausibly conjectured a missing vertical stroke at the beginning of the third line, which would yield another cursive E and the word **ęt**, producing the following reading:

magister
i.Terebius
ęt.Vibolen
us

[68] Pp. 671, 1053 (photo tab. 101 fig. 3), Cingulum; Ve 240a2.

[69] On anaptyxis (with special reference to the Praenestine cases) see also Campanile "Elementi" 15, and more recently (concerning Oscan, Paelignian and South Picene anaptyxis) Meiser "Pälignisch" 121f. (For the sequence *-tr-/Tr- > -ter-/Ter-* of **magisteri**, **magistere/Terebius**, cf. SPi. *matereíh.*)

[70] See **13.6** on this word-division type.

This analysis is seconded ("IIT prorsus probabile") in CIL I^2 (fasc. 4); as far as the **et** of line 3 is concerned, it is very likely correct.

There are, however, three points of divergence worth noting between the CIL representation (above) and the photograph, of which two are quite straightforward. Relatively trivial is the fact that there is no apparent qualitative difference between the two B's, despite the CIL differentiation between curved and angular versions: both appear to have more or less the same angular quality, much like the angular R and S. Less trivial is the alleged upright N: this is simply incorrect, since the photograph reveals a markedly inclined N, which, together with the angled L, is significant in evaluating the relative date of such an inscription.

4.7.c The third problem is more complex, and attaches to what has been taken as the first character of line 1, namely a ligature of M plus open A. Combinations of M and *closed* A, of which two versions are listed, for example, by Cagnat (*Cours*, p. 25: cross-stroke on either right or left side), are attested with certainty for the (late) Republic;[71] but ligatures of M (and N) with *open* A are exceedingly rare, and in the early period seem to be restricted to the compressed genres where most early ligatures are found (apart from line-end), i.e. seals and other name-inscriptions on small areas or objects (lanterns, gemstones, election programmata, etc., cf. **12.1.b** below): thus CIL 521 **L.Manilio**, 519 **Lamia** (?), 544q **an/na** (all on lanterns).[72] Thus a ligature of this type in an early dedicatory inscription (and at *line-beginning*, where space-saving considerations leading to ligatured spellings are rarely operative) would be highly surprising (cf. **12.1.d** on CIL 366 **malo** [M+closed A] at line-end). Moreover, inspection of the photograph reveals that the connection between the second and third strokes is not well made: rather, there is a slight but visible break between the two. All of this indicates that we have here not a ligature, but rather a complete open A, preceded by the *right half* of an incomplete four-stroke

[71] Recently-published examples include C.Mati (*Epigraphica* 49 [1987] 124f., seal no. 5,), Cam(ilia) (ibid. 246ff.), Ma (bis) *AE* (1989) 163.

[72] The vase-fragment inscriptions collected in CIL 2910b, found near a structure destroyed in the late third century B.C., contain two abbreviations with ligatured Ma (both with closed A), i.e. LOMa (no. 14) and L.Ma (no. 15); but the perpendicular L and the closed-A ligature suggest a later period.

(slanted) M, the left half of which is missing, due to the broken left edge of the inscription: line 1 thus begins]ΛΛ, not]ΛΛ . Given the missing first stroke of a cursive E already apparent at the beginning of line 3 (cf. **4.7.b** above), this new interpretation of line 1 — which also accounts more naturally for the probable vertical alignment of this simple two-term expression — suggests in turn that the beginning of line 2 is probably also short by a half character, which must again be taken as the missing first stroke of a cursive E. We have, then, line-initial sequences

]ΛΛ
]ꟻ.T
]ꟻT

and the inscription can therefore be read as follows:

]magister
]ę.Terebius
]ęt.Vibolen
us

The resulting **magister | ę** is thus directly comparable to the early Praen. **magistere** of CIL 59,[73] and provides an interesting new nom. pl. datum for this area.

[73] Not **magistere(s)**, as traditionally (e.g. Ernout *Recueil* 33 ad loc.), see Wachter *Altlat. Inschr.* §§87a-b.

CHAPTER FIVE

"Mircurios" and Related Problems

5.1 *Introductory*
5.2 *Praen.* ***Mirq-*** *(CIL 553)/****Mirc-*** *(564) vs.* ***Merc-*** *(563) and "Delian Latin"*
Mirq-/Mirc- *vs.* ***Merc-***
5.3 *CIL 2873b* ***Hircol****, 2890* ***Mirc***
5.4 *On the Dialect Geography of erC > irC*
5.5 *Excursus: CIL 563* ***Mercuris*** *and* ***Iovos***

5.1 *Introductory*

5.1.a The **i** of early Praenestine **Mirqurios** (CIL 553) and **Mircurios** (564) vis-à-vis **Mercuris** (563), and of **stircus** (in the famous North Apulian "Lex Lucerina", CIL 401) vis-à-vis Lat. *stercus,* is traditionally explained as a "dialectal" feature, and compared with familiar material from Oscan (*amiricatud* Ve 2, **amirikum** Ve 3, **mirikui** Ve 136) demonstrating the same treatment *erc* > *irc*.[1] As often with such features, however, both its nature and extent remain somewhat unclear. Thus some discussions (e.g. Ernout *Éléments* 60f.) conceive of the process in question in very general terms, affecting the sequence *er* before any consonant, while others (see e.g. Sommer-Pfister) specify *erc* > *irc* only. Despite the standard appeal to the Oscan examples, there is some uncertainty as to the range of this "dialectal" phenomenon in other speech areas: thus Coleman, in his concluding discussion of possible Sabine examples ("Central Ital." 117), claims that this feature, if it is indeed to be assumed for Sabine, "agrees with both Marsian and Oscan against Umbrian and Faliscan"; nevertheless, he cites no comparable data in his survey of Marsian (111ff.) — nor, to my knowledge, are any to be found[2] — and on the other hand

---

[1] See e.g. Leumann *LLuF* 45, Sommer-Pfister *Hdbch.* 54, Campanile "Elementi" 13, Lazzeroni "Contatti" 295.

[2] Apart from CIL 2873b **Hircol**, from Marsian territory (**5.3** below), but cf. 2873c **Herclo**.

seems to ignore the possibility that Fal. **loifirtato** (Ve 253), **[l]oifirta** (Ve 276) might reflect the same (or at least a very similar) process, as is often thought.[3]

5.1.b Indeed, the entire premise has recently been questioned: as usual (cf. §**2** of the "Introduction"), Wachter rejects the assumption of dialectal influence for **Mirc-/Mirq-** and **stircus**, referring these forms instead to the general instability of /ĭ/ and /ĕ/ to be construed from many early inscriptions (including urban ones), on the basis of alternations like **filia/filea**, **hic/bec**, **aidilis/aidiles** (nom. sg.), **Menerva/Minerva**, etc. (*Altlat. Inschr.* §§110f, 196b). This instability (and the vacillating notations it engendered) is not to be denied, and actually incorporates several different subtypes; but there can be no reasonable doubt that forms like **Mirc-/Mirq-** and **stircus** are qualitatively different: unlike **filia/filea** etc. (**i/e** generally in open syllable or before a single consonant, likewise the frequent **dedet/dedit**[4] and **mereto/merito**, also CIL 9 **tempestatebus**, 398 **trebibos**), we have here a distinctive phonological environment (/erC/, if not actually /erk/), including postvocalic /r/, a notorious catalyst of vowel-quality adjustments. The picture becomes still clearer if the full range of "Mircurios" attestations is considered, as Lazzeroni has already shown. In what follows, then, I first seek to support the traditional understanding of forms like Praen. **Mirc-/Mirq-** with reference to the somewhat neglected Delian Latin evidence, and explore further implications of this material for the Praenestine data (**5.2**). After examining two new possible *erc* > *irc* cases (**5.3**), I briefly address in **5.4** the problem of circumscribing the dialectal profile of this process more precisely; the concluding Excursus (**5.5**) considers the implications of a similar dialectal feature in Praenestine Latin for another Praenestine problem.

---

[3] For this possibility see e.g. Campanile "Elementi" loc. cit., Giacomelli *Lingua fal.* p. 117; cf. also (pseudo-)Ven. *Jfirtati*, **5.4.d** below (with more on Faliscan at n. 26).

[4] Cf. also **didit** (CIL 610, **3.2.a** above).

5.2 *Praen.* ***Mirq-*** *(CIL 553)/****Mirc-*** *(564) vs.* ***Merc-*** *(563) and "Delian Latin"* ***Mirq-/Mirc-*** *vs.* ***Merc-***

5.2.a The "dialectal" status of the **Mirc-/Mirq-** forms emerges with particular clarity from the attestation of four such forms in Latin inscriptions from Delos,[5] which Wachter — like most other scholars — does not note in connection with Praen. **Mirc-/Mirq-**.[6] Lazzeroni ("Contatti" 294ff.) has convincingly argued that "il latino dei *negotiatores* in Grecia non è il latino di Roma", on the basis of detailed surveys not only of *erc* > *irc* (p. 295), but also of three other features well attested in Greek locales (esp. Delos) and typical of Latin inscriptions from Oscan-Umbrian areas, namely nom. pl. *-e(i)s* (cf. Ch. **8** below), the orthographic practice of "geminatio vocalium" (cf. Ch. **11** below), and the dat. in *-a* (cf. **15.2.c** below). More specifically, Lazzeroni concludes (p. 306) that "Il latino dei *negotiatores* in Grecia è il latino della Campania", which can be further supported on the basis of onomastic and historical data.[7]

5.2.b It may be possible to add a fifth feature to the four features consistent with Lazzeroni's claims regarding the Campanian basis of the Delian Latin inscriptions; while not quite comparable (since it is not, strictly speaking, an Oscan feature), it is nonetheless attested in Oscan, and deserves to be mentioned in this connection.

Porzio Gernia (*M e D* 151f.) has shown that while Oscan by and large preserves final *-m* intact (Cipp. Abellan., Tab. Bant., Agnone tablet, *iúvila*-dedications, etc.), *m*-loss is attested with some frequency in later Pompeiian inscriptions (i.e. the **eítuns** group), in coins from Campania and adjacent areas, and in the defixiones, including the Oscan-Latin Ve 7 from Cumae. If, as seems most likely, Porzio Gernia (following Väänänen and Tronskij) is correct in taking this feature as due to "un influsso del latino locale", then we have another defining feature of (late second- and

---

[5] **Mircurio** CIL 2233, 2239, **Mirqurio** 2240, **Mirquri** 2504.

[6] A recent exception is Prosdocimi, in *Veneti* 242.

[7] See esp. P. Poccetti on "Romani e Italici a Delo", *Athenaeum* n.s. 62 (1984) 646ff., with rich bibliography; specifically on Mercury, note also B. Combet Famoux, *ANRW* II 17.1 (1981) 464ff., esp. 498 concerning associations between the *magistreis Mirquri* of Delos and the annual collegia of Capuan *magistri.*

early first-century) "Campanian Latin" (as also, to be sure, of some other varieties of Latin, although generally more evident in earlier texts). It is at least possible, then, that CIL 2239 **donu(m)** (here **Mircurio**) and 2504 **eisde(m)** (here **Mirquri**) are to be interpreted in this way, despite Porzio Gernia's inclination to view these forms as abbreviations (*M e D* 150). Indeed, it is suggestive that several other forms among those she lists as possible abbreviations (149f.) are from Campanian texts of this period (thus CIL 674 **faciundu(m)**; Capua, 110 B.C.).

5.2.c The relative chronology of the Delian attestations has not hitherto been considered in connection with this problem, but may be of some interest in evaluating the nature of the "Mirc-/Merc-" alternations.

In general, the **Mirc-/Mirq-** alternants with **i** appear to be characteristic of the older stratum of these dedications, where they are found with some regularity: thus **Mirc-** is attested in CIL 2239, which may well be the oldest of these texts (approximately mid-second-century or slightly later), in the phrase **magistres.Mircurio.et.Maia.donu.d**: here note **magistres**, the dat. in *-a,* and **donu** (cf. **5.2.b** above and **eisde(m)** below). **Mirq-** appears in 2240, which may be slightly later, in the similar phrase **magis[t]reis.Mirqurio.et Maiae**,[8] as well as in 2504 (113 B.C.) **magistreis.Mirquri**, a text with numerous orthographic archaisms: note here **Hercolei**, **eisde(m)**, **Papeirio**, **Pilo**, and **Maicius**, **Sexteilius** with archaizing diphthongal spellings but "modern" **-us**, note also the modern inflection and geminate of **Apollini(s)**.[9] In contrast, the "L. Orbius" dedications,[10] which show at least one late feature (715 **palaestrae**) and could well be datable to approx. 87 B.C. (if Mommsen's identification of "L. Orbius" is correct, see CIL p. 531 ad CIL 717), contain CIL 2242 **L.Orb[---]** | **Mer[curio]**.

---

[8] See Ch. **8** below on **-es** vs. **-eis**, note also dat. **-ae**.

[9] On the inflection of "Apollo" see Ch. **9** below. Gordon's suggestion that **Mirquri** in CIL 2504 is a "mistake" on the part of the writer or cutter (*Introduction* 13, p. 89) is incomprehensible, as is his query (p. 198, where Sommer-Pfister *Hdbch.* 54 is duly cited, cf. n. 1 above) regarding the possibility of "Greek influence" for this form.

[10] CIL 715, 716, 717 (p. 531 **M.Orbius**, but see pp. 726 and 940 for the correction to **L.Orbius**), 2242, 2252 (**L.L.Orbieis.L.l**); see also Poccetti "Romani e Italici" (n. 7 above) 649 on CIL 2252 (= Degrassi *ILLRP* 755), and 653 on the anaptyxis in Ὀρόβιος vis-à-vis *Orbius;* cf. now also Campanian **Orofi(us)**, *AE* (1989) 154 (Cales), 162 (Capua).

Of particular interest, finally, is CIL 2233: although not especially early (a first-century dating for the accompanying Greek inscription seems assured), this is a rather crudely-lettered graffito, and not a formal dedicatory text.[11] As such, it would not be surprising for elements of popular speech to be preserved even at this time, and thus it seems significant that **Mircurio** here co-occurs with a dative in **-e** (**Apolline**, beside archaizing **Iovei**) and a dative in **-a** (**Minerva**).

5.2.d The above observations concerning the relative dating of **Mirq-/Mirc-** vs. **Merc-** in Delos lead us to reconsider Praenestine **Mirq/ Mirc-** vs. **Merc-** in the same way.

Indeed, of the three Praenestine texts, CIL 553 (**Mirqurios Alixentrom**) seems clearly to be the oldest, and is probably one of the few inscriptions assignable to the "dark ages" of the fifth-fourth centuries (similarly Wachter *Altlat. Inschr.* §213a). Both CIL 564 (with **Mircurios**) and 563 (with **Mercuris**) show evident signs of antiquity, and must surely be no later than the third century; but the two inscriptions cannot be dated with respect to one another on the basis of contrasting features. Nevertheless, the initial I- (vs. DI-) of CIL 563 **Iovos** places this text (together with the mirror CIL 551 **Iuno Iovei Hercele**) among the later members (or at least among those that show the least adherence to the traditional spelling, cf. **2.2.c** above) of the Praenestine bronzes (cf. the mirror CIL 558 **Venos Diovem Prosepnai**, and **Diovo** on the third-century bronze plaque CIL 60.) Thus it is at least possible, if not probable, that Praen. **Merc-** reflects a "modern" variant of earlier **Mirq-/Mirc**, much as in the data from Delos. Interestingly (but perhaps also predictably), the Delian material retains this particular feature (to be considered "Campanian", in the Delian context) for perhaps a century after it ceases to be attested in the Praenestine material.

[11] The facsimile (provided in the original publication) is most instructive (P. Roussel and J. Hatzfeld, *BCH* 33 [1909] 509f., with Fig. 4).

5.3 *CIL 2873b* ***Hircol****, 2890* ***Mirc***

5.3.a Apart from the "Mircurios" forms, there is another theonym that is generally ignored in this connection, or (on the sole occasion it has been invoked with regard to **Mircurios** etc.) explicitly dismissed, in view of certain paleographic ambiguities. The case, nevertheless, deserves to be reconsidered.

The third-century pedestal inscription CIL 2873b,[12] found near Trasacco in Marsian territory, is rendered as follows in CIL:

The divine name in the second line, in which the Oscan-style closed H is noteworthy,[13] appears to read **Hircol** (presumably for dat. **Hircol(e)**, see further below on the missing desinence), but has not been so interpreted.

5.3.b Letta-D'Amato (ad loc.) at first admit the possibility of a **Hircol** comparable to forms of the type **mirikui/Mircurio** etc. in Oscan and Latin. But this possibility they reject, as also the supposition of an error (i.e. a missing stroke after the H, thereby producing a cursive E), preferring in the end to take the sequence HI as a kind of ligature or digraph expressing /he/, to which they compare the use of a ligatured HE in a late Paelignian inscription (Ve 215k = CIL 3238) **T.Helevis.Herclit**.[14] But the assumption of a ligatured notation is not attractive. As will be discussed in more detail in Chapter **12** (cf. also **4.7.c**), a ligature in a third-century inscription of this type is to be regarded with grave suspicion. Moreover, even if one wishes to argue for a relatively high frequency of ligatured spellings in Oscan-speaking territories on the basis

[12] P. 880; Letta-D'Amato *Epigrafia* 137 (photographs Tav. 48).

[13] The top and bottom horizontal strokes cannot be seen in Letta-D'Amato's right detail-photograph, but are clearly visible in the left photograph of the entire pedestal.

[14] Krummrey's notice of this problem (CIL p. 880) merely reports Letta-D'Amato's conclusion.

of the frequent use of ligatured spellings in Oscan, this practice in Oscan is again not terribly old,[15] nor is ligatured HE itself well-represented; cf. rather Osc. **heriiad** (Ve 4.9) or **heretatei** (Pocc 129), with initial sequence HE-, but ligature elsewhere in the word. Nor is the Paelignian instance (the sole ligature of the usual type [cf. **12.2.-3**] found in the Paelignian corpus) of much value, given the late date of this inscription; and the same reservations would apply to such ligatures found in Pompeiian programmata and the like. Note further that one cannot claim the ligature either to have been motivated (in terms of composition or engraving) or to be supported (in terms of our interpretation of the text) by what appears to be a line-end abbreviation, suggesting a need for compression earlier in the word: as will be shown in Chapter **13**, the techniques for word-division at line end to be reconstructed for this time and place (see esp. **13.3-4**) suggest that no such constraint would have been operative in this context (on **Hircol** esp. **13.5.b**). The ligature hypothesis falters as well, finally, on the central question of precisely how to interpret the characters in question, in the absence of parallels for such a notation of **He-**. If it is the H-character itself that stands for **He-** (as sometimes in Greek), the following extra stroke is inexplicable (except as an error), since a **Heircol(e)** is clearly excluded.

5.3.c It would seem, then, that the entire sequence HI- is what such a theory must somehow take to represent **He-**: in this case, as Letta-D'Amato seem themselves to admit, it is simplest to take H as equivalent to the identical character of the native Oscan alphabet, and the following stroke as an error, standing for an incomplete cursive E (**II**). But this last assumption is at least doubly problematic: note first that the engraver has just successfully negotiated **Atieius** in line 1, with the far more daunting sequence **ATIIIIVS**. Moreover, study of the photographs shows that the engraver's spacing technique with cursive E, as shown precisely by this last form, is quite exact: the cursive E clearly occupies its own letter space, which is provided by spacing the surrounding I's very closely with their adjacent characters (according to a technique not uncommonly found with I), somewhat as follows: **A TI II IV S**. The spacing of what appears to be

[15] Thus the Agnone Tablet and the *iúvila*-inscriptions have no ligatures at all.

HIRCOL in the second line shows that the character after the H is treated identically with the I's of **Atieius**, with extremely close spacing vis-à-vis its surrounding characters. In view of all these considerations, then, it seems preferable to read simply **Hircol**, and not **Hęrcol** vel sim., as in the CIL transcription *Hęrcol(e?).*

5.3.d Letta-D'Amato observe that even if one reads **Hircol**, the form would not reflect the same *ĕ* > *ĭ* process as "Mircurios", since here we would presumably have *ē* > *ī*. But a connection with "Mircurios" is still not excluded: it is conceivable, for example, that instead of reflecting /ī/ < /ē/, cf. Osc. **lígatúís** (for which no certain examples are quotable from Latin),[16] the **-i-** of **Hirc-** reflects precisely the "Mircurios" treatment directly, assuming an Osthoff-like shortening /Hērc-/ > /Hĕrc-/, or else an analogical spelling for this theonym based on Osc. /Mir(i)k-/ and/or other locally-used Lat. "Mirc-" forms.

5.3.e To the eight attestations of "Mircurios" generally cited should be added the possible instance newly published in CIL 2890 (p. 891), although originally noted by Vaglieri (*Not. scav.* 1907, 458 n. 2; photo fig. 36) and briefly discussed by Ryberg (*Record* 122) in her account of third-century material. CIL (here Krummrey) transcribes the lettering (painted on a fragment of the base of a dish found in Rome) as **MIPC**, and follows Ryberg's interpretation *Mirc(urio).* Krummrey further cites Ryberg's third-century dating, and her judgment that the object was made "by a workman who was more familiar with the Greek alphabet than with the Latin", which would account for the rho-like **<P>** = /r/. This assumption, however, may be unnecessary, if this form of R is to be assumed for CIL 34 **port** (3rd c.), as seems likely (**3.3.g** above).[17] Note also that despite the CIL transcription, Vaglieri's photograph appears to show an open character (and not a completely closed **P**), which is not a regularly-occurring Greek variant of rho (see Jeffery *Local Scripts* 34 and "Table of Letters"). Ryberg claims that since "a vase of such quality would hardly be worth importing from elsewhere, it was undoubtedly made in a local

[16] Despite Ernout (e.g. *Recueil* 37), Praen. **leigibus** (CIL 62) is probably not to be interpreted this way, see Wachter *Altlat. Inschr.* §86h with n. 625.

[17] See also **3.3.h-j** on the possible non-Roman provenience of CIL 34.

pottery"; but such an object (or perhaps the letterer) might also be of non-urban provenience (as the vocalism of the form would suggest in any case), and in this connection the final punctuation (i.e. actually **MIPC.**, to judge from the photograph) may be of interest (cf. **4.3.f** above), despite its omission from the CIL transcription.

5.4 *On the Dialect Geography of erC > irC*

5.4.a The feature under discussion, "attestato sporadicamente ma su un'area assai vasta" (Campanile "Elementi" loc. cit.), has a somewhat unclear dialectal profile, as already mentioned; and the "area assai vasta" is stretched still further by the new Veneto-Latin form *]firtati* (on which **5.4.d** below). But the essential restriction to Faliscan on the one hand and various "Central Italic" speech forms on the other (esp. Oscan, also "Campanian Latin" and possibly Sabine) seems more or less clear.[18] Moreover, the complete absence of this *e*-raising tendency[19] from Umbrian is striking: beside forms with *-erC-* that can in principle have been restored from parallel sequences *-erV-*,[20] other forms not susceptible to such pressures consistently show *-erC-*,[21] a sequence also attested in South Picene (cf. TE 6 *nerf, persukant*).[22] I conclude, then, by commenting briefly on several forms that have been claimed not to show this process, or that seem to fall outside the general area predicted for it.[23]

---

[18] Thus recently Joseph and Wallace "Patois" 168ff.

[19] On its optional character see recently Eska "Pompeiian" 153f. ("the change must have been very slight because it is often ignored in spelling", thus Osc. **pert**, not ****pirt** etc.); similarly Giacomelli loc. cit. for Faliscan (**loifirta** but **loferta**).

[20] Thus *ander-*/**anter-**C (*andersistu* etc.) after *ander-V*, **berva** (cf. abl. **berus**), **herter** (cf. **heri, eretu** etc.).

[21] Thus *couertu*/**kuvertu**, *perca*/**perkaf**, *persclo*/**persklum** and *persnimu, pertom-e, Serfer*, **terkantur**, etc.

[22] On the analysis of Umbrian/South Picene isoglosses, see esp. Meiser "Pälignisch" 105ff.

[23] I here ignore various forms transmitted in literary sources (*commircium, firmus, *firctum* [P.F. 75.17 L, cf. *HSCP* 90 (1986) 113], *virga*, etc.), which cannot be localized with precision (except for possible Sabine connections in some cases); see in general Ernout *Éléments* 60f. and Coleman loc. cit. for the Sabine forms.

5.4.b As already noted (cf. **5.1.b** above), Wachter rejects the association of CIL 401 **stircus** (Luceria) with Osc. *erc* > *irc* etc. But Luceria is adjacent to Samnite territory, and indeed was probably under the control of Oscan-speaking Samnites until its colonization by Rome in the late fourth century; on the importance of this point for interpreting other features of this inscription that may be "contact-induced" (esp. the famous imperatives **fundatid**, **parentatid**, for which even Wachter grants the possibility of "local influence"), see R. Wallace, *Glotta* 66 (1988) 211ff. (Cf. also Osc. *amiricatud* [Tab. Bant.], not far to the south.)

5.4.c CIL 1920 **Mircurio** (Firmum Picenum), in Umbrian territory, seems surprising, as does perhaps CIL 2295 **Mircurio** from Lissa in Dalmatia. But Picenum is adjacent to Sabine territory, which may well have known this feature, and at least some of the colonial inhabitants of Firmum would presumably have spoken non-urban varieties of Latin.[24] In any case, the frequency with which "Mircurios" is attested may suggest that this was to some extent a traditional spelling, which might well appear (especially in later archaizing dedicatory contexts) beyond the strict geographical bounds originally appropriate for this trait.

5.4.d The possibility that the same process may be ascribed to Venetic has been raised because of Veneto-Lat. *Nircae* (*MLV* *121-04, *LV* Es IV),[25] in contrast with Ven. *ne.r.ka* and *ne.i.rka.i* (see *MLV* p. 106). The problem, however, appears in a new light in view of the new late-first-century attestation *]firtati* (also from Este), which has been discussed at some length by Prosdocimi (in *Veneti* 242f.). Prosdocimi is almost certainly correct in taking the form as "il corrispondente genericamente 'italico' di lat. *libertati*" (i.e. dat. of a theonym '*[Li]bertati*'), perhaps more specifically to be associated with Faliscan (although the absence of the root vowel renders this last assumption less certain).[26] Thus *Nircae,* especially

---

[24] I am indebted to Rex Wallace for this last observation.

[25] I.e. CIL 2782 **Nircae** (Este), cited by Lazzeroni ("Contatti" 295 n. 85) among Latin attestations.

[26] In view of the sporadic nature of this process in Faliscan (cf. **loferta** [n. 19 above], frequent **mercui**), Rex Wallace raises the possibility (per litt.) that the Faliscan cases of *erC* > *irC* (all late middle Faliscan at the earliest) may themselves stem from dialectal Latin sources.

in view of its late date, is also best accounted for via non-urban Latin (or similar dialectal) influence, and neither this form nor *Jfirtati* provide evidence for the *e* > *i* process in Venetic per se.

5.5 *Excursus: CIL 563* ***Mercuris*** *and* ***Iovos***

5.5.a If, then, the vocalism of Praen. **Mirq-/Mirc-** is best explained via the "dialectal" (whether in this case essentially Campanian or Faliscan) process discussed above, it is legitimate to reconsider the extent to which Praenestine Latin may show other traces of dialectal influence that can be localized with some degree of precision. This is a difficult problem that deserves a full-scale investigation, which cannot be undertaken here. (Compare, once again, §2 of the "Introduction".) The form CIL 563 **Mercuris**, however, already met with above (**5.1.a**, **5.2.d**), provides an interesting test case of this sort that may be offered in relatively brief compass. Here it is the ending, of course, that seems to show a non-urban form that is most familiar from Oscan, and this is the traditional interpretation,[27] especially in view of the early Praenestine mirror-signature **Vibis.Pilipus.cailavit** (CIL 552), with the same form of ending in a quintessentially Campanian name.[28] Wachter — in his reluctance to countenance dialectal influences in Praenestine Latin — raises two objections to this interpretation of **Mercuris**: first, this name in Oscan (as in Faliscan) is inflected as a *u*-stem (thus Ve 136 **mirikui**); and second, no other features of this inscription are attributable (or at least attributable "klar genug") to a foreign engraver. The first objection is easily dismissed: while *u*-stem inflection would certainly clinch the matter, its absence does not eliminate the possibility that the (predictably-used) *o*-stem form might have received this non-urban nominative, precisely as in **Vibis**. The second objection is more cogent: the case for **Mercuris** (which, according to Wachter, might be nothing more than an error, given the obvious error **Diama** for **Diana** in this text) would certainly be bolstered if further

[27] Beginning from Ernout "Parler" 342f.; more recently e.g. Colonna in *Lap. Sat.* 68 (see Wachter *Altlat. Inschr.* n. 336 for further references).

[28] See Salomies *Vornamen* 96f., with analysis of both Latin and Osco-Umbrian attestations.

evidence of recognizably "Campanian" material could be found in the same inscription.

5.5.b At first sight, no such evidence is forthcoming: apart from the slip **Diama**, nearly all of the other forms (besides **Mercuris**) in this sequence of eleven theonyms show predictable (for this period) versions of their standard Latin counterparts (**Iuno**, **Hercles**,[29] **Apolo**, **Leiber**, **Victoria**, **Menerva**, **Mars**, **Fortuna**). But the remaining form is exceedingly odd, namely **Iovos**. This form (already met with at **2.2.c** above) is discussed at some length by Wachter (§55c, cf. also §62f), who assumes (I think correctly) that the form is nominative. Wachter observes that nom. **Iovos** cannot be directly equated with the widespread archaic nom. *Iovis*[30]: whereas nom. *Iovis* is generally explained as an analogical creation based on gen. *Iovis* after the type *civis/civis, navis/navis* etc.,[31] early Praenestine Latin shows consonant-stem gen. sg. *-os/-us* (CIL 60 **Diovo, nationu**, 62 **Salutus**), probably also to be assumed for *i*-stems, such that one cannot appeal to influence from *i*-stem paradigms for this period. Wachter then plausibly argues for the development of nom. *Iovos* (for earlier **(D)ious*, on which see Wachter §62f) through influence from paradigms like that of *Venus* (early *Venos/*Veneros*, cf. early Praen. **Venos**, CIL 550), and/or folk-etymological associations with the word *iūs* (i.e. early **iouos*).

Nevertheless, the resulting early Praen. paradigm *(D)iovos* (nom.) / *(D)iovos* (gen.) is structurally identical to Enn. et al. *Iovis/Iovis*. It thus seems possible that in addition to influence from *i*-stems, the latter could reflect a more or less direct replacement of this early Praenestine type, consequent on the replacement of gen. sg. *-os/-us* by **-es/-is*. Moreover, nom. sg. *Iovis*, in addition to its frequent attestation in early poets (where metrical exigencies are in evidence in all three of the instances preserved in metrical contexts),[32] has certain claims to "vulgar" status, and indeed more

[29] Previously read **Hercle**, but see Wachter *Altlat. Inschr.* §55a.

[30] Enn. *Ann.* 241 Sk = 63 V, also attested for Naevius, Caecilius, Pacuvius, and Accius, among early authors (further Varro *L.L.* 5.66, cited by Wachter at §62f).

[31] Cf. Leumann *LLuF* 448.

[32] On the Ennius passage see Skutsch *Annals* ad loc.; Accius 331 Ribb. and Caecilius 36 Ribb. both line-final.

specifically Campanian associations: note *Iovis* Petr. *Sat.* 47.4 (Trimalchio) and 58.2 (Hermeros), similarly nom. *bovis* 62.13 (Niceros), cf. Boyce *Freedmen* 50. Much the same is true of gen. sg. *-os,* thus CIL 675 **Venerus** (Capua, 108 B.C.), 677 **Cererus** (Capua, 106 B.C.). Conceivably, then, early Praen. nom. **(D)Iovos**/gen. **Diovo(s)** is directly comparable to an early Campanian parallel **Iovos/*Iovos* ancestral to *Iovis/Iovis,* in which case the Campanian interpretation of the **-is** of **Mercuris** in this inscription may find some indirect internal support after all.

CHAPTER SIX

Latin af

6.1 *Introductory*
6.2 ***af** in the "Epistula ad Tiburtes" (CIL 586)*
6.3 *On Previous Analyses of **af***
6.4 *Attestations of **af**: Survey and Conclusions*

6.1 *Introductory*

6.1.a According to the handbooks, the origin of the variant **af** (for *ab*) is unclear (e.g. Leumann *LLuF* 158, Sommer-Pfister *Hdbch.* 219, Ernout-Meillet *Dict.* s.v. *ab*), but it is widely thought to be "dialectal" (thus explicitly, for example, Sommer-Pfister, citing Walde-Hofmann *LEW*). The classic discussion in these terms is that of Ernout (*Éléments* 92ff.): after citing Cicero's well-known discussion,[1] and analyzing the inscriptional examples known up to Ernout's time, he concludes (94): "la forme *af* se rencontre dans les documents provenant de régions où les dialectes locaux ont résisté le plus longtemps au latin classique ... . Par son origine, *af* se dénonce comme une forme dialectale, qui a pénétré à Rome, ainsi que bien d'autres dans la langue juridique." Further comparing the well-known form Pael. *afēd* 'abiit' or 'abdidit' (Ve 213), as well as Osc. **aflukad** (Ve 6.3) and **aflakus** (Ve 6.10, 11), Ernout observes: "*Af* était donc une préposition suditalique; c'est ce que confirment les documents épigraphiques latins".

6.1.b More recently, Wachter (*Altlat. Inschr.* §221c) has explicitly (and predictably, given his "anti-dialectal" bias),[2] rejected the "dialectal" analysis of **af**: "Um eine dialektale Erscheinung handelt es sich hier nicht,

---

[1] "Una praepositio est *af*, eaque nunc tantum in accepti tabulis manet, ne his quidem omnium, in reliquo sermone mutata est", etc., *Or.* 158, whence the discussions by Priscian (II.35.18 K) and Velius Longus (VII.60.12 K).

[2] Cf. §**2** of the "Introduction", as well as **4.1.a** and **5.1.b**.

denn sie kommt auch in gut stadtrömischen Dokumenten vor". Although Wachter does not provide an explicit account of **af**, his immediately following discussion of **ar-** 'ad-'/**apur** and *au-*, which he takes to reflect the results of assimilatory processes, imply a similar conception for **af**; indeed, analyses of **af** based on assimilation have a long history, although Leumann (*LLuF* 158) judged two of them to be unconvincing (more on which below).

6.1.c Despite Wachter's pronouncement, the dialectal approach continues to find strong support, most notably in work of R. Giacomelli. In addition to modernized restatements of the classical dialectal explanation,[3] Giacomelli has most recently provided a detailed discussion[4] based partly on Susini's study of the famous "Tabula Popilliana" milestone (CIL 638; Polla, in Lucania), where the phrase **af.Capua** appears in the same text with **ab.Regio**.[5] Giacomelli's findings, moreover, have been endorsed by M. Peters, *Sprache* 33 (1987) ad *Idg. Chron.* 33.H 233.[6] To summarize briefly (see "Ancora su 'af'" 134f. for details), Susini determined that this text actually consists of a collation of at least two disparate compositions: (i) a relatively formal self-*elogium* (*"index rerum a se gestarum"*), based on a pre-existing document, which was probably simply copied; (ii) the actual *"tabula milliaria"*, listing the technical and prosaic details (proper to this document only) concerning distances traversed or to be traversed. As it happens, the standard form **ab** appears in the formal elogium (**viam.fecei.ab.Regio.ad.Capuam** etc.), while **af** appears in the prosaic listing (**suma.af.Capua.Regium.meilia.CCCXXI**), "una situazione che soddisfa pienamente la nostra idea di distribuzione sociolinguistica di *ab/af*" ("Ancora su 'af'" 135). Indeed, Giacomelli goes on to say that "in piena zona italica, un arcaismo come *af* potesse diciamo ammiccare dal punto di vista espressivo a parlanti ben lontani da Roma e facilitare a questi la

---

3 "Un altro caso di commutazione automatica diglottica nel latino epigrafico", *IF* 87 (1982) 82ff. (hereafter cited as "Commutazione"), cf. also *Graeca Ital.* 72 ("variante socio-linguistica"), 119 ("elemento sociolinguistico"), similarly 121.

4 "Ancora su 'af' in Cicerone, 'Orator' 158 e nel latino epigrafico", *Acme* 41 (1988) 129ff. (hereafter cited as "Ancora su 'af'"), renouncing some of the views in "Commutazione".

5 G. Susini, *Le lapis de Polla* (1984).

6 "G.s Deutung von *af* als *doppione "rustico"* von *ab* ... wird durch eine neu Analyse der *tabula Popilliana* [i.e. Susini *Lapis* — BV] ... glänzend bestätigt".

comprensione di ciò che era essenziale, cioè la *tabula milliaria*". We will have occasion to return to this conception in **6.2** below.

6.1.d Despite the evident appeal of this analysis, there is still the nagging question of exactly how to explain the *-f* of **af**. As for actual dialectal support, Giacomelli correctly acknowledges the doubt attached to the interpretation of the Osc. **af-** forms,[7] but adduces, again, Pael. *afēd* (vis-à-vis Lucil. *abzet* 583 Krenkel = 581 Marx) as a certain instance of a dialectal *af*. Otherwise (129f.) one is left with alternants like Lat. *ruber/rūfus* or Lat. *līberta*/Fal. **loferta**, which do little to explain **af**, except to imply that the regular "dialectal" reflex (in some unspecified area) of the segment corresponding to Lat. *-b* (of *ab*) is simply *-f*, much as IE **-dh-* yields Lat. *-b-* (in *līberta*) but Fal. *-f-* (in **loferta**).[8]

Giacomelli, to be sure, insists on the synchronic nature of his analysis; and it is for this reason that he rejects all appeals to assimilation,[9] since **ab** and **af** clearly coexisted at certain stages of Latin, and can be described in sociolinguistic terms akin to a diglossic situation. But from a *diachronic* point of view, a form like *af* could well have arisen (in some dialect area or areas) via assimilation. In short, it seems to me that the approaches of Wachter (**af** from assimilation/non-dialectal) and Giacomelli (**af** dialectal/not from assimilation) are in fact not mutually exclusive, once the problem is considered diachronically. In working out a synthetic version (**af** probably dialectal, having arisen via assimilation), it will be convenient to turn next to a second textual analysis provided by Giacomelli, this time involving precisely an early attestation of **af** in one of those "gut stadtrömischen Dokumenten" that led Wachter to reject Giacomelli's conception.

---

[7] "Ancora su '**af**'" 131; see esp. Untermann "Preverbs" on the interpretive difficulties attendant on these and other preverbs in Osco-Umbrian.

[8] Cf. **6.3.a** below for a more explicit proposal of this sort.

[9] "Commutazione" 84, "Ancora su 'af'" 133.

6.2 *af in the "Epistula ad Tiburtes" (CIL 586)*

6.2.a Directly after his analysis of **af** in the Tabula Popilliana (cf. **6.1.c** above), Giacomelli attempts to lend further support to the dialectal provenience of **af** by analyzing the "expressive" character of its use in CIL 586, the well-known mid-second-century official Roman "Epistula ad Tiburtes" ("Ancora su 'af'" 135f.).[10]

According to Giacomelli (p. 136):

> ... la lettera del pretore ... rivela una certa "informalità" nella sintassi alquanto spezzata, anacolutica, ipotattica nella forma ma paratattica nell'*allure* dell'organizzazione espressiva e inizia bruscamente con un *quod* causale. La presenza di numerosi (e consueti) iper-arcaismi ... non attenua, malgrado l'intenzione di preziosismo, l'aspetto complessivo di un testo prolissamente bonario, dotato di una tensione espressiva vicina a quella del "parlato". La presenza di *af* in simile contesto (*de eieis rebus af uobeis peccatum non esse*), nell'intento che si è detto, potrebbe rappresentare una "concessione" espressiva, non incongrua in una vera *consolatio* a provinciali puniti dal Senato ... . E di tono informale è anche *uostrum* per *uestrum,* fatto per analogia su *nostrum.*

6.2.b This is a highly subjective and, to my mind, entirely unconvincing analysis. Quite apart from the details concerning the use of **af** and other allegedly expressive features of the text (on which see below), the likelihood of finding such features here is automatically very low, if Frederiksen ("Errors" 187) is correct in seeing this not as the full text of the senatorial decree, but rather a local version giving its "gist" only.

As for the text itself: despite Giacomelli's special pleading for a vaguely sensed "informal" or "expressive" character, no single syntactic feature of the document points in this direction. The contorted and

---

[10] This document, it may be noted, figures in a confusing lapsus in Ernout's otherwise lucid discussion of the problem in *Éléments:* on p. 94, Ernout mistakenly refers to **af.Capua** and **ab.Regio** (Tab Popill.) as occurring in the Epistula ad Tiburtes.

repetitive construction, far from exuding an expressive and good-natured prolixity grounded in popular speech, is rather a hallmark of archaic (and archaizing) legal-official style, as is to be expected in view of the numerous traits of archaizing orthography (on which see now Wachter, *Altlat. Inschr.* §124d), as well as pervasive bits of phraseology that clearly owe more to "officialese" than to popular speech: **v.f.** = *v(erba) f(ecistis)*, **animum.advortit**, *animum inducere* (3x), etc. The initial "causal" *quod* — the sole specific syntactic feature Giacomelli cites — may well have struck the addressees of this document (as it did Giacomelli) as a somewhat brusque opening; but the construction itself is well attested, for example, in Cicero's formal style (see e.g. Ernout-Thomas *Syntaxe* 295), and must be taken here as a feature that lends the document formality, and not a popular ring. Nor would it be difficult to multiply other syntactic usages that are more characteristic of archaic and/or official style than of alleged vernacular elements, such as **ita.utei** (2x), the "agentive" dative *senatuei* in **senatuei.purgati.estis**, and *dignus* with relative and subjunctive in **dignos.esse.quei.ea.faceretis**.

6.2.c The second (and only other) linguistic index of "informal tone" adduced by Giacomelli — namely **vostrum** — is without value, since the vocalism of this form (vis-à-vis *vester*) is more likely to reflect an archaism (thus e.g. Leumann *LLuF* 47, 463, Schmidt *Stammbildung* 213).[11]

6.2.d In view of these considerations, it becomes impossible to endow **af** in this text with the subtle expressive overtones Giacomelli would have us hear in it. The sincere (if patronizing) tone this *consolatio* may have derives not from any alleged stylistic informality, but rather from the heavy-handed use of an array of stock features typical of archaic Roman

[11] In addition to Umbr. *uestra* (VIb 61), which could in theory continue an inherited pronominal **u̯ē̆s/*u̯ĕ̄s*, the further testimony of Fal. nom. pl. ves (Ve 243, Archaic Faliscan) seems generally to be neglected (the form is not mentioned, for example, by Schmidt), but see Giacomelli *Problemi* 64ff. Together with the **su̯ēsl/*su̯ĕ̄s* of Celtic (OIr. *sí* etc., cf. Schmidt *Stammbildung* 218), these forms might well point to an archaic *e*-grade of some sort, the precise analysis and extent of which remains unclear (see Schmidt 220ff.). In any case, an inherited **u̯ēs/*u̯ĕ̄s*, even if reflected in Umbr. *uestra* and/or Fal. ves, does not undermine the **u̯ōs/*u̯ŏ̄s* clearly attested in Lat. *vōs*, OLat. *voster*.

Rechtsprache. We must recognize, then, that **af** in CIL 586 is attested as an integral part of this system, and cannot be adduced as a trace of the purported dialectal origin of **af**. On the contrary: an explicit theory of **af** as a dialectal element must assume that **af** has penetrated this form of official language as a kind of hyper-archaism,[12] much as in Giacomelli's (and others') conception of the consonant-stem gen. sg. ending *-os/-us* (cf. **5.5.b**), to name just one such feature. Indeed, it is interesting to note that in the Tabula Popilliana, with allegedly "expressive" **af**, the form **paastores** — with the "dialectal" feature of "geminatio vocalium" (see Chapter **11** below for details) — occurs not in the "informal" *tabula milliaria* (with **af**), but in the (second portion of the) formal *elogium*. Even though its appearance here may perhaps have been partly conditioned by considerations of spacing (cf. **11.4.e**), such a form was evidently admissible in a formal context, like **af** in CIL 586. I am inclined to believe, then, that even in the Tabula Popilliana (which is probably some two decades later than the Epistula ad Tiburtes), the appearance of **af** owes more to the fact that it is (as Giacomelli notes) an "arcaismo" of a certain sort (more on which below) than to any expressive character the form may have, despite Susini's brilliant reconstruction of the varied textual fabric of the document.

6.3 *On Previous Analyses of* ***af***

6.3.a An explicit account of the sort "*-f* from dialectal treatment of **-dh(-)*" (cf. **6.1.d**) was in fact offered by Lindsay (*Lat. Lang.* 576, as one of several possibilities), according to which **af** may be cognate with Ved. *ádhi*, traditionally said to mean 'on, in' (with loc.) and 'out of, from' (with abl., the usage Lindsay cites, naturally enough).[13] Ernout (*Éléments* 95) rejects this theory, partly since an original **ndhi* should yield Lat. **endi* or **indi*, a reservation reiterated by Giacomelli ("Commutazione" 87). In fact, the etymology of *ádhi* — which has only doubtful correspondents in Iranian, not to mention elsewhere — is not so clear (see now Mayrhofer

[12] Cf. Ernout's conclusions, cited at **6.1.a** above.

[13] On the syntax and semantics of *ádhi* see now H. Hettrich, *MSS* 52 (1991) 27ff.

EWAia I.1 67 s.v., with references). Moreover, in view of "Untermann's Law" (*$n̥$ in initial syllable > Proto-Sabellic *an-*, cf. Meiser *Lautgesch.* 69f.), an original *$n̥dhi$ could conceivably have yielded an Osc./Pael. */anfi/*, spelled *af*. Thus Ernout's second argument against comparison with *ádhi* may be stronger, namely that (again, in traditional terms) the locative value (and hence the locative government) — and not the ablatival one (originally presumably 'out from [on]' etc.) — seemed to Ernout to be primary. As is now clearer from Hettrich's study of Rig-Vedic usage ("Grundbedeutung" roughly like Germ. 'oben'), the rather complex syntax of *ádhi* bears little resemblance to Lat. **af**.

6.3.b In the absence of such a source, then, it is surely most natural to seek an explanation based on phonetic conditioning, which is likely to take the form of assimilation. As already noted above, Leumann (*LLuF* 158) cites two "unsatisfactory" earlier attempts to explain **af** in this way:

(i) According to Wölfflin (*ALL* 7 [1892] 506), the development of *ab* > *af* is an assimilatory consequence of sequences *ab v-;* this was based on the three inscriptional examples **af.vobeis** (Epist. ad Tib.), and **af.vinieis, af.villa** (both CIL 1853), and on an item excerpted from Festus generally interpreted by earlier editors (24.2 M, 19.31 Th, Lindsay *Lat. Lang.* loc. cit.) as *afvolant* (glossed 'avolant') for the *aeuoluunt* of the MSS.[14]

An almost identical (but rather more elaborately-conceived) formulation, based on the same three inscriptional examples, was arrived at independently by Bréal (*MSL* 8 [1894] 48); in addition, expanding on an earlier treatment concerning the pronunciation of *f* in Italic languages (*MSL* 7 [1892] 321f., esp. 323), Bréal saw **af** as reflecting an intermediate stage in a sequence of developments *ab* > *af* > *av* > *au* (whence *auferō, aufugō*) > *ā* (whence *āmittō, āvertō* etc.).[15] Also apparently independently,

[14] Lindsay (24.9 L) later preferred to print the form as †*aevolunt,* oddly without comment (other than to cite the MS reading).

[15] Giacomelli ("Ancora su 'af'" 133), citing Bréal's 1894 study, mistakenly imputes to Bréal a sandhi-explanation concerning *ab/af* involving pre-consonantal vs. pre-vocalic position, but no such conception is to be found in that study; similar ideas were discussed by Bréal in the 1892 study, but not with reference to *ab/af*. (Giacomelli's presentation at

Lindsay (*Lat. Lang.* [1894] loc. cit.) raised the same assimilation analysis as one of several possibilities: "a Latin variety of *ab* (or *au* ?) with *f* produced originally under the influence of some following consonant (most probably *v*)".

(ii) For von Planta (*Gramm.* 1.477f.), the development **sr-* > *fr-*, together with the "close phonology" to be expected in prepositional syntagms, accounts for *af* starting from sequences **aps r-* > *af r-*, for which he cites a phrase *af Roma,* which does not, however, seem to be attested. Von Planta specifically (478 n. 1) rejected Wölfflin's account, arbitrarily asserting that the fact of *af* being attested primarily before *v-* must result from some later development, the nature of which von Planta failed to specify.

6.3.c A more precise variant of the same theory was arrived at independently by Bücheler (*RhM* 46 [1891] 235 n. 1): as a result of sequences *af r-* (from original **aps r-*), *af* was extended to sequences *af l-* (he cites the phrase *af Longo,* more on which below, as well as the fact that *af* is attested "gerade vor *l* mehrmals"), and finally extended to use before other consonants (cf. **af speculu**). But if the relative frequency of **af** before *l-* is held to be significant (despite the complete absence of **af** before *r-*), what of the relatively frequent **af** v- cases? In any event, the presumed resyllabification **aps r-* > **a(p) sr-* and subsequent generalization of **af r-* to *af r-* would need to have occurred exceedingly early for **sr-* > **fr-* to be invoked at all; in that case, one would rather expect **af** to be attested, by the second century, with complete freedom in all contexts — and yet, in addition to the suggestive patterning with certain consonants, it is barely attested before vowels, as will be seen shortly.

It is clear that both assimilation analyses raise serious questions, especially with regard to the data: what is the status of the alleged frequency of **af** before *v-* and before *l-*? For the latter, Bücheler cited the example provided by Velius Longus (see n. 1 above) *af Longo;* but *af* with the grammarian's own name may be a completely specious invention, as his discussion is otherwise cribbed from Cicero, and provides no new

"Commutazione" 84, citing both of Bréal's studies together with Wölfflin's, is more accurate.)

information (cf. Ernout op. cit. 93). It is not surprising, then, that Ernout (93f.) judged Wölfflin's proposal to be "arbitrary", in the absence of forms like Lat. **afuehō* and the like. But it is curious that modern scholarship, in associating the "dialectal" explanation with Ernout's study, has lost sight of the fact that in the end, Ernout himself suggested an assimilation analysis that is essentially a variant of Bréal's formulation: "L'hypothèse la plus plausible est que *af* est une graphie destinée à noter l'affaiblissement de *b* final en un phonème spirant, sans doute proche du *v* français, soit **aβ* devant sonore initiale du mot suivant, et **af* devant sourde; l'insuffisance des alphabets italiques n'a pas permis de noter cette nuance, si bien que la spirante sonore et la sourde correspondante ont été notées indistinctement par *f*" (op. cit. 95). We can now, I believe, place such analyses on a somewhat firmer footing by examining the data more closely, especially since the small corpus of **af** cases generally cited can be enlarged by a few forms.

6.4 *Attestations of* ***af****: Survey and Conclusions*

6.4.a Even Giacomelli's recent surveys of examples ("Commutazione" 84, "Ancora su 'af'" 133) are essentially based on Ernout's incomplete listing (op. cit. 93), as is Leumann's (*LLuF* 158), and Giacomelli unfortunately introduces several confusing inaccuracies.[16] Thus, apart from the desirability of a complete listing for purposes of analysis, the following survey (with brief commentary for some items) may be useful.

The following Republican instances (approximately Sullan, except as noted) have long been known, having been published in CIL I^2 (fasc. 1-3):

(i) CIL 586 (Epist. ad Tiburt., ca. 159 B.C.) **af.vobeis**[17]

(ii) CIL 638 (Tab. Popill., ca. 132 B.C.) **af.Capua** (here also **ab.Regio**)[18]

---

[16] The same can be said of the listing at *TLL* I.3.42ff.

[17] *TLL af vobis* [sic].

[18] *TLL* mistakenly lists a second attestation of *af vobis* for this inscription (= CIL I^1 551).

(iii) CIL 728[19] (Rome) **af.Lyco** (bilingual dedication from the people of Laodicea "near (the river) Lycus")

(iv) CIL 808 (Rome) **af.mil[(iario)**

(v) CIL 1471 (Praeneste) **af.muro**

(vi) CIL 1522/3 (Ferentinum) **af.solo**, cf. perhaps CIL 1710 (Luceria, "litteris vetustissimis") **ạf[.solo].**

Giacomelli ("Ancora su 'af'" 133 n. 16) dismisses CIL 1522/3 as a "vox nullius", claiming that **[solo]** is merely a supplement conjectured by Mommsen; but he has confused the genuine **af.solo** of CIL 1522/3 (cited by Ernout as CIL I[1] 1153, Ferentinum) with the fragmentary CIL 1710 (Luceria). In any event, the phraseological similarity between 1522/3 and 1710 is striking (1523 **A.Hirtius.A.f.M.Lollius.C.f.ces. fundamenta. murosque.af.solo.faciunda.coeravere. | eidemque.probavere**, cf. (with Mommsen's restorations) 1710 **[---]ụs.N.f | [---]ỵius.L.f | [---]us.C.f [praif]ectei | [turreis.]portas | [moiro]sque | [fecerun]ṭ[.]ạf | [solo.eisdemque.probarunt]**), and thus *"af solo"* remains a highly plausible restoration for 1710, perhaps reflecting a fixed bit of municipal phraseology;[20] cf. the similar Oscan locution in a Pompeiian municipal inscription (Ve 8.10-11): **imaden.uupsens.íú- | su. aídilis.prúfattens** 'ab imo [i.e. a solo] fecerunt, iidem aediles probaverunt'.

(vii) CIL 1853 (Amiternum) 7 **af.vinieis**,[21] 9 **af villa**, 10-11 **af | [castell]o**; note further 2 **af** at line-end (with missing initial in line 3), and **at** probably written for **af** in 12 **at.angulo**.[22] Here also 4 **ab.castello**, 15 **ab.segete**.

---

[19] Giacomelli ("Ancora su 'af'" 133) incorrectly "*CIL* I[2] 720".

[20] Similarly **ab solo usque ad summum | fecit** (Capua, late Republican; *AE* [1982] 173); further **a solo** *AE* (1984) 315, **a s[olo]** *AE* (1985) 359.

[21] *TLL af vineis* [sic].

[22] Degrassi *ILLRP* 487 mistakenly records **at** for **af** also at line 14, where CIL had originally read **ad**, now corrected to **ab** (CIL p. 1049 [cf. Degrassi *Imagines* 216], similarly already CIL p. 664 ad loc.).

(viii) CIL 2444 (Nemus Dianae, 3rd/2nd c.) **af.louco.** This important early attestation was published too late (CIL I^2 fasc. 2, 1931) to be included in Ernout's early listing, but oddly does not appear in either of Giacomelli's surveys.[23]

6.4.b The following two examples are attested in Imperial inscriptions (2nd-3rd centuries A.D.):

(ix) CIL VI 17780 = I^1 1055 (Rome) **af | Lucretia**

(x) CIL XIV 2772 (Labici, near Tusculum) **af specu | lu Diane** (*"speculum Dianae"* apparently referring to a body of water not identified with certainty, see Mommsen's discussion ad loc.).[24]

6.4.c To these can now be added the fragmentary pedestal inscription CIL 2869[25] (Ager Capen., 3rd c.), found with a series of similar inscriptions to Feronia (CIL 2867-8, 2910, cf. **7.6.f** (iii) and **7.6.f** ad fin.):

]ɳo
]ąfluc
]ɱere

e.g. (after CIL, comparing 2444 **Diana.af.louco**, **6.4.a** (viii) above):

[dedet.]ɱere(to)

[23] Cf. "Ancora su 'af'" 133: "Una ricerca più specificamente attenta al dato epigrafico, a parte il *lapis* di Polla ... offre i seguenti esempi".
[24] Giacomelli ("Ancora su 'af'" 133) incorrectly "*af muro* e *af speculu Diane CIL* I^2 1471"; correctly kept apart at "Commutazione" 84.
[25] P. 876, photo tab. 11 fig. 1.

The letter forms suggest a late third- or early second-century dating, as for other inscriptions in this series,[26] although the early monophthongization in **luc** is noteworthy.

6.4.d We find, then, the following attested sequences:

(i) *af l-* : **af.louco**
af()luc
af.Lyco
af Lucretia
(*af Longo* ?? cf. **6.3.c** above)

(ii) *af v-* : **af.vobeis**
af.vinieis
af.villa
(perhaps *afvolant,* cf. **6.3.b** (i) above)

(iii) *af m-* : **af.muro**
af.mil[

(iv) *af s-* : **af.solo**
af speculu

(v) *af c-* : **af.Capua**
af | [castell]o

(vi) *af a-* : **a<f>.angulo**

Despite the small number of forms, the patterning seems significant in certain ways. The almost complete absence of **af** before vowel is conspicuous, and indeed the sole instance before vowel occurs in a text that shows a great deal of variation: not only **af v-** (2x), but also **af |**

[26] Note that the photograph seems to show the right side of an open A (with right stroke) or a closed A with angled interior trokes, not the A with horizontal cross-stroke of the CIL rendering; also: inclined N, angled L, slanted M, small O, R with short tail, and cursive E in the second E of **mere** (cf. **15.2.a** (vii), **15.2.b** n. 10).

[castell]o beside **ab.castello**, as well as **ab.segete** (more on this point below). On the other hand, the three oldest attestations show **af** before **l-** (**af.louco**, **af()luc**, in the same expression) and **v-** (**af.vobeis**), in all cases with back rounded vowel in the first syllable, a pattern mirrored in the other **af l-** cases (**af Lucretia**, **af.Lyco**, strikingly with the same initial sequence as **af.louco**, **af()luc**).

6.4.e Indeed, thanks to one of Giacomelli's penetrating socio-linguistic insights, we can now see more clearly that from a diachronic perspective, certain attestations have a secondary status. Giacomelli observed ("Ancora su 'af'" 133, 136) that the persistence of **af** into Imperial times supported the idea that to a great extent, **af** could be viewed as "un tecnicismo da linguaggio settoriale, quello della topografia, dei confini", i.e. a form of composition in which **af** persists "in un uso 'incongruo' e indifferente con *ab*". This is clearest, as Giacomelli notes (133), in CIL 1853, in which we have a technical document much like the *tabula milliaria* portion of the Tabula Popilliana, largely consisting of "topographical" sequences *ab X ... ad Y*, and in which we have already noted the extreme variation in usage. Much the same technical characterization applies to the early building inscriptions CIL 1471,[27] 808,[28] and 1522/3 (**af.solo**, cf. **6.4.a** (vi) above), as well as to the late marker CIL XIV 2772.[29] The Tabula Popilliana falls precisely within this set, as already indicated. All of these documents, then, are likely to show a form of the language in which **af** has been generalized beyond the original conditions responsible for its origin, and so the attestations of **af** therein should simply be left aside when considering the question of phonetic behavior. If we therefore eliminate these examples of technical usage, as defined by Giacomelli, we are left precisely with the three early instances **af louc-/af luc-** and **af vo-**, and the dedicatory **af Lyco** and **af Lucretia**, a set so phonetically consistent (including, as it turns out, the

[27] **latum.af.muro.ad | L.Tondei.vorsu.p.XVI.**
[28] **[via.gl]area[.]sternenda.af.mil[| [LXXVIII et per A]p[e]nninum** etc.
[29] **af specu | lu Diane | usq(ue) f(undo) Cle | mentia | no.**

three earliest instances of **af**) as to render, in my view, the historical explanation via assimilation indisputable.[30]

6.4.f In principle, there are several ways of making more precise phonetic sense of this distribution, but these must largely involve speculative developments. The following observations, however, can be offered by way of conclusion.

First, it is tempting to compare the Umbrian (and partly also South Picene, with some variation) sound change *l-* > *v-* (cf. **3.6** ad fin.), which for Umbrian must have been completed by the early tbird century (see Meiser *Lautgesch.* 155ff.). In a number of non-urban areas around the time of **af.louco/ąf()luc**, then, sequences ordinarily spelled **ab lou-** or **ab lu-** might well have been phonetically almost identical to *af vo-* (i.e. /aβ wo:-/, cf. Wachter's analysis of **arvorsum** etc., very similar to the Bréal/Ernout spirantization account), whence naturally spellings like **af lou-/af lu-** after **af vo-**.

Alternatively, one could appeal to the fact that with respect to certain developments even within urban Latin, *v-* and *l-* behave phonologically as a "natural class", as in the well-known *līber/vīcus* rule, involving, as it happens, **loi-* (and following labial) and **voi-*, i.e. *l-/v-* followed by a back rounded vowel.[31] It seems possible, then, to account for the parallel patterning of **af lou-/lu-** and **af vo-** purely on the basis of a similar non-urban treatment not directly related to the Umbrian process just mentioned.

Note finally that the conception of **af** proposed here has the effect of reducing the significance of Pael. *afūed,* in contrast to the traditional "dialectal" interpretations of **af** (cf. **6.1.a**). In view of the lateness of the inscription in which this form is found, the appearance of *af-* before a continuant other than *l-* or *v-* is in fact not surprising, and can now be taken to reflect the later, generalized stage reflected in the Latin "technical" usages, as discussed above, where **af** is also attested, for example, before **s**. In principle, if not for the difference in genre between the Paelignian inscription (on which see **16.5** in much more detail) and the Latin "technical" inscriptions, Pael. *af-* could even be ascribed to Latin influence

[30] P.F. *afvolant* may well belong here, although *af Longo* is rather more doubtful, as already noted.

[31] For details see esp. Parker *Rel. Chronol.* Ch. 7.

(like much else in Paelignian of this period), against which Lucilius' *abzet* cannot be used as evidence. Pael. *afḋed*, in any case, poses no serious difficulty for the analysis of **af** suggested here.

CHAPTER SEVEN

The Thematic Ablative Singular

7.1 *Introductory*
7.2 *Methodological Preliminaries: Prat's Inscriptional Corpus*
7.3 *Seventh-Fifth-Century Evidence*
7.4 *CIL 2658 pro()fileod and prō+ Ablative*
7.5 *Other Prepositions*
7.6 *"Instrumental" mer(e/i)to(d)*
7.7 *Adverbs in -ē*
7.8 *Other Inscriptional Data*

7.1 *Introductory*

7.1.a According to a theory set out at length by L. Prat in his book on the archaic Latin ablative (*Ablatif*), the Latin thematic "ablative proper" (in *-ōd, -ād*), expressing such notions as source and origin, remained both formally and functionally distinct from a similar (but *d*-less) "locative-instrumental" form (in *-ō, -ā*) as late as approximately 200 B.C. Prat claimed that this difference was systematically observable in early inscriptional data, and also in certain facts of Plautine meter (especially involving hiatus), the latter forming the basis of a detailed statistical study.[1]

7.1.b Prat's theory is not without adherents, especially among Francophone scholars: it has been accepted by J. Haudry (cf. *Homm.*

[1] The approximately contemporaneous study of M. Porzio Gernia (*M e D*) likewise incorporates a detailed analysis of inscriptional *d*-loss after long vowel (171ff., including Italic dialect material), as well as an extended study of Plautine hiatus (for *-d:* esp. 183ff., 248ff.). The chronological and topographical orientation of the inscriptional part of her work, however, is quite different from that of Prat, and she does not arrive at a "true ablative" vs. "locative-instrumental" distinction like the one just described. Indeed, some of the results of her study tend to weaken this theory, as will be noted below.

Schilling 482f.), and it is favorably invoked by others.[2] Moreover, Prat's treatments of individual inscriptions are regularly cited, together with Porzio Gemia *M e D*, in the most recent fascicle (4) of CIL I[2]. Such a theory, however, must be evaluated with some care: Prat's hypothesis, which is chronologically incompatible with standard accounts,[3] would be extremely interesting if true: needless to say, what appears to be the survival of the Indo-European *o*-stem instrumental up to such a late period would have important consequences for Latin and Italic historical morphology. Moreover, with one partial exception (to be mentioned shortly), the published reviews of Prat's work have conspicuously failed to address his treatment of the inscriptional evidence, which is the primary focus of the discussion that follows.[4] And it is the early inscriptional evidence — despite most of the reviewers' (perhaps understandable) inclination to focus on the literary data — that is critical for this hypothesis, for simple chronological reasons: Prat himself repeatedly acknowledges that the distinction he envisions had largely eroded by the time of Plautus.[5]

7.2 *Methodological Preliminaries: Prat's Inscriptional Corpus*

7.2.a In view of what has just been said, it seems symptomatic that of the four extended reviews of Prat *Ablatif*, the two strongly positive evaluations[6] have nothing substantive to say about Prat's treatment of the inscriptional data, while addressing at length the details of Prat's literary analysis. More reservation is expressed by P. Monteil (*BSL* 72.2 [1977]

---

[2] E.g. X. Mignot (with some reservation: "Si l'on adopte la thèse de Louis C. Prat..."), *Étrennes Lejeune* 136 n. 16; Jiménez Zamudio *Peligno* 152 n. 7. On favorable reviews, cf. **7.2.a** and n. 6 below.

[3] See e.g. Leumann *LLuF* 411, 426; Ernout *Morph. hist.* 29f.; within a more general discussion of syncretism in the Latin case system, see also R. Coleman, *Studies Palmer* 47ff.

[4] It is odd that Wachter's recent study (*Altlat. Inschr.*) considers neither Porzio Gemia *M e D* nor Prat *Ablatif*, despite frequent discussion of problems involving final *-d*.

[5] This last judgment is entirely consistent, it should be noted, with Porzio Gemia's findings on the artifical nature of Plautine hiatus (*M e D* 300: "Gl'iati sono apparsi strettamente legati alla struttura ritmica e la fenomenologia che li contraddistingue è regolata dalla posizione nel verso").

[6] P. Burguière, *Kratylos* 21 (1976) 147ff.; E. Liénard, *Latomus* 35 (1976) 626ff.

163ff.), who nevertheless, in the end, seems to agree with Prat's thesis,[7] and who offers only minor adjustments to Prat's handling of two inscriptions. In contrast, P. Flobert (*REL* 54 [1976] 366ff.) provides a sharply negative evaluation, which begins from a detailed (but still fairly concise) critique of the inscriptional data. In general, it can be said that the deficiencies of Prat's epigraphic analyses are even more serious than is apparent from Flobert's critique. Some of the specific points raised by Flobert will concern us below; but we must first consider a fundamental methodological question concerning the corpus of data chosen by Prat as the basis for his epigraphic analyses.

7.2.b On this point, Flobert (367) notes only that the Senatus Consultum de Bacchanalibus (CIL 581) was excluded by Prat, "parce que ses graphies sont jugées trop archaïsantes pour être sincères à cette date". In fact, Prat's data selection principles are more capricious than this statement implies. For this particular document, Prat's reservations (see *Ablatif* 15ff., 68 n. 2) have as much to do with an alleged "dialectal" (esp. Oscan) element he sees therein — an illegitimate exaggeration based on Ernout's discussion (*Recueil* 61f.) of certain features (e.g. consonant-stem genitives in *-os/-us*) that do not of themselves prove the "dialectal" provenience or coloring of a document (esp. a Roman official one, whether a local copy or not). Indeed, this tactic is pervasive: hence Prat's exclusion of other documents thought to show "dialectal" traces, and also Flobert's general (and valid) reservation (368) concerning Prat's "recours excessif aux 'osquismes' et aux 'ombrismes'".

7.2.c Moreover, it is difficult to comprehend why Prat chose generally to ignore all inscriptions after CIL 620 in CIL I^2 (cf. *Ablatif* 11ff.), especially many of those published in the CIL I^2 supplement volumes (fascicles 2 and 3), thereby omitting many clearly archaic texts with relevant ablative forms — not to mention texts published in other readily accessible collections, such as Degrassi's important and widely-used

[7] Pp. 166f.: "...les conclusions en ce qui concerne le latin du IIIe siècle A.C. cadrent avec ce que pour notre part nous pensions être".

anthology *ILLRP*, a work that does not seem to have been consulted at all.[8] Unfortunately, in contrast to this excessively exclusionary approach, Prat conversely, on many occasions, adduces material that should have been excluded, according to his own selection principles, but which nevertheless appears to have been brought forward in support of his theory.[9]

There are, then, serious problems and indeterminacies introduced by Prat's selection of the material itself, among other methodological problems to be discussed below.[10]

7.3 *Seventh- to Fifth-Century Evidence*

7.3.a As for Prat's interpretations of ablative forms in the two most archaic inscriptions he admits into his corpus (the "Duenos" Inscription [CIL 4] and the Forum Inscription [CIL 1]): Flobert (367) has already remarked on the fragility of Prat's arguments (*Ablatif* 33f.) for taking the sequence **malo** in the Duenos Inscription as an ablative with instrumental value.[11] Conversely, in the Forum Inscription (cf. Prat *Ablatif* 29ff.), the **]od** in the sequence **]od.iouxmen | ta.kapia** (10-11), which is the only *-od* form in this text Prat feels is susceptible of analysis,[12] need not be taken as an ablative with "valeur d'extraction-origine". Moreover, despite Prat's arguments (well-taken) against some of the details of Dumézil's understanding of the phrase in 15-16, an "instrumental" interpretation of at least one (if not all) of these forms in *-ōd* remains the most likely.[13]

---

[8] It is absent from his bibliography; cf. section C.1 (*Ablatif* xxxiff.), listing editions of Latin inscriptions.

[9] Several such examples will appear below, where the discussion should make clear the methodological difficulty just described.

[10] In light of the above observations (and as will become more evident shortly), I can agree neither with Burguière's description of Prat's work (147) as an "étude exhaustive des inscriptions latines antérieures au S.C. des Bacchanales", nor with Liénard's comments (626) on Prat's "rigorous methodology".

[11] For **malostatod** see rather Rix "Duenos"; cf. also **16.6.c** below.

[12] Cf. also **quoiba | velod** (13-14), **]odiovestod | loi{u}quiod** (15-16).

[13] Cf. **1.7** above; for "instrumental" interpretation of 13 **]odiovestod** ("auf Grund eines rechtmäßigen ...") also Rix "Duenos" 199.

7.3.b The sixth-/fifth-century Corcolle altar fragments (CIL 2833a, cf. Chapter **2** above), first published after Prat's study, show a form **]ṃod** (B2) that may well be an ablative. Although my conjectured restoration **iovos̱i[d:optu]ṃod** for A2 + B2 ("Notes" 225ff.) must now be rejected as such (**2.1.b** above), a form like **[optu]ṃod** (possibly even preceded by an ancestor of *iūre*) remains a strong possibility; in this case, it would be difficult to see an ablatival "valeur d'extraction/origine", as opposed to an instrumental ablative (which would again run counter to Prat's prediction). But the structure of the text is too unclear for secure conclusions to be drawn.

Prat fails to mention the interesting fragment CIL 361b, which may well be a fifth- or fourth-century text (cf. Wachter *Altlat. Inschr.* §213a, with facsimile). Line 11 contains the sequence **]o̱d.di[**, which is of course multiply ambiguous; in principle, however, it could reflect something like *quod/eod die* (cf. CIL 366 **quo.die, eod.die** [**7.8.a** (iv) below], 583.63 [Lex Repetund.] **quo.die** et sim.), which would contradict Prat's expectations.

Thus, apart from the now clear phrase **p̱ro()fileod** of the Tibur Pedestal inscription (cf. **3.1** above), to be discussed in more detail in the next section, there is essentially no usable evidence in favor of Prat's theory from seventh-fifth-century material, and several possible indications against it.

7.4 *CIL 2658* ***p̱ro()fileod*** *and prō + Ablative*

7.4.a The reading **pro()fileod** in the Tibur Pedestal inscription can now be integrated into Prat's inconclusive discussion of the behavior of *prō* in early inscriptions (*Ablatif* 48ff.). Citing Ernout-Thomas (*Syntaxe* 115) and Szantyr (*LSuS* 270), Prat expects *prō* to govern a "true ablative" with "valeur d'origine"; he was able to adduce, however, only the following evidence from inscriptions that might be early enough to provide information for this theory:

pro + *-od* (i.e. conforms to "valeur d'origine" expectation)
CIL 42 **pro.Cn.filiod**
CIL 401 **pro.ioudicatod**[14]

pro + *-o*
CIL 40 **pro | poplo**
CIL 359 **pro | C.Rutilio**

7.4.b Prat explicitly discounts the testimony of CIL 2440 **pro | sed.et.familia.sova.**,[15] on the basis of "le modernisme de l'écriture". But this example could have been supplemented with the phraseologically similar (and probably somewhat earlier) CIL 2839,[16] readily accessible in Degrassi *ILLRP* :[17]

[d]ederon[t.pro.sed]
domod.fa[miliadque]
sovad.[18]

The testimony of **pro()fileod** now attests *prō* + *-ōd* unequivocally for the sixth-/fifth-century period.

7.4.c Prat is forced to describe this situation of "flottement dans la graphie" as follows: he theorizes that the original "valeur d'origine" appropriate for *prō* was no longer clearly felt (for reasons that are not made clear), as a result of which "les Latins hésitaient devant de telles formules et tantôt faisaient sonner le *-d* d'origine, tantôt s'en abstenaient"

---

[14] As an "inscription osco-latine" (at least by Prat's admission, *Ablatif* 50), this example should not, strictly speaking, have been adduced, according to Prat's own criteria, as he himself seems to admit.
[15] Prat's transcription (*Ablatif* 50) mistakenly places the line break before **pro.**
[16] P. 862; Wachter *Altlat. Inschr.* §149i, Degrassi *ILLRP* 294 (*Imagines* 125).
[17] It is properly cited, together with CIL 2440, in Peruzzi's listing of *pro* with ablative in early inscriptions ("Marsi" 175), which Prat seems not to have consulted.
[18] Cited here with Wachter's expansions, as opposed to Degrassi's (= CIL) less satisfactory **[d]ederon[t.pro] | domod.fa[miliad] | sovad.**

(*Ablatif* 51, similarly 69); he is not surprised to find, then, that the Plautine statistics for *prō* (*Ablatif* 205f.) seem to indicate, if anything, that "Plaute considérait l'ablatif qui suit la préposition *pro* comme un ablatif vocalique". But this imposition of what amounts to a synchronic "variation-analysis" (however chic such analyses may be) is specious: what the data indicate — note especially the contrast between **[pro] ... domod ... sovad** (CIL 2839) vs. **pro ... familia.sova** (CIL 2440) — is simply the expected loss of *-d* in inscriptions from the late third/early second centuries,[19] as per the traditional understanding of the archaic Latin ablative and its immediate antecedents.

7.5 *Other Prepositions*

7.5.a Prat's analyses of other prepositional usages are likewise unsatisfactory. In his discussion of early examples of "ablatifs à valeur d'extraction-origine", Prat cites (*Ablatif* 37ff.) three instances of *dē*, all with *-ād:* CIL 48/49 **de.praidad**, 365 **de | zenatuo.sententiad**; but the latter example — which in any case contains, as Prat himself shows, a number of "dialectal" features, and need not be earlier than the mid-second century — should simply have been excluded from consideration, according to Prat's criteria.

7.5.b Oddly, there is no discussion of inscriptional *ab;* yet the evidently early CIL 2444 **Diana.af.louco** (Nemus Dianae; note angled L, inclined N, open A) provides a clear counterexample to Prat's expectations. Certain features traditionally labeled "dialectal" (**af**, dat. in *-a* **Diana**) might have allowed Prat to exclude this example in any case; but the partly urban pedigrees of both features render such an exclusion problematic.[20]

7.5.c As for *sine* (*Ablatif* 51f., cf. 207f. for the Plautine evidence), the sole example offered is CIL 366 (Lex Spolet.) **sine.dolo**, from a

---

[19] Well under way already by the mid-third century, according to Porzio Gernia (*M e D* 175).

[20] For **af** see Chapter **6**; for the dat. in *-a*, see **15.2.c**.

document Prat had earlier considered to be characterized by "ombrismes" (*Ablatif* 24). (See further **7.8.b** below for more on CIL 366.)

7.6 *"Instrumental" mer(e/i)to(d)*

7.6.a For "instrumental" ablatives, which under Prat's theory should be found (if early enough) without *-d*, the main evidence comes from the fixed expressions using **mereto(d)/merito(d)** (more rarely **merto(d)**):[21] here Prat claims (*Ablatif* 40ff.) that there is a core of early examples of **mereto** etc. without *-d*, while forms with *-d* are generally later. But there are severe problems with this analysis, which crucially depends on delicate judgments of relative chronology for the inscriptions in question; unfortunately, as Flobert has observed of these documents (367), "elles semblent presque contemporaines et les critères employés par la chronologie relative sont assez inopérants", such that the contrast between (allegedly early) **mereto** and (allegedly slightly later) **meretod** is "d'une précision illusoire". Since one of Prat's prime examples should now be differently read in a way that contradicts his findings, and in view of other relevant material omitted from consideration, it may be worthwhile to recapitulate briefly Prat's argumentation, as a preliminary to some brief comment on the forms in question; once again, this will show that Flobert's reservations can be stated more strongly.

7.6.b The *mer(e/i)to(d)* data adduced by Prat fall into three categories, namely (i) early cases in which a line-final *-d* is said to be unclear (*Ablatif* 41), (ii) early cases without *-d* (41ff.), and (iii) slightly later cases with *-d* (43f.), as follows:

(i) CIL 9.6 **dedet.tempestatebus.aide.mereto[**
CIL 29.3-4 **Aiscolapio.meritǫ[| lubens**

[21] See in general Euler *Dōnom* for these expressions.

(ii) CIL 62.3 **dat.lubs.merto**[22]
CIL 31.2 **donum.dedet.mereto**
CIL 45.1 **Diana.mereto**
CIL 384.3-4 **dono.ded | mereto**
CIL 386.2-3 **Ive.dono | ded.mereto**
CIL 388.3-4 **dono.dedet | lubs.mereto**
CIL 28.2-3 **donom.dat | lubens.merito**

(iii) CIL 32.3 **donom.dedit.meretod**
CIL 360.3 **dedit.meretod**
CIL 1696.2 **dedit.meretod**
CIL 33.3-4 **donum.dat.libenş | meritod**
CIL 27.3-4 **dono.dedit | meritod**

According to Prat, set (ii) is distinguished from set (iii) not only by *d*-less forms **mereto** etc., but also by **meret-** (vs. **merit-**), acc. **dono(m)** (vs. **donum**), **lub-** (vs. **lib-**), and **dedet** (vs. **dedit**), in which the first-named alternant reflects the more archaic form. But the inconsistencies apparent from the examples themselves (thus (iii) **meret-** 3x, also **donom/dono**) preclude these features from being used as strict indicators of relative chronology, as Flobert has properly observed. Indeed, there are still other factors that serve to undermine Prat's analysis of these forms even further.

7.6.c As for set (i): there is no reason to expect a final *-d* for the **meritǫ** of CIL 29. Wachter (*Altlat. Inschr.* §149f) has observed that a *-d* would need to have been engraved on the edge,[23] but there is no indication that the edge contains such a letter. Note, incidentally, that this gives us a relatively early instance of a *d*-less form **meritǫ** (not **mereto**).

7.6.d The following points concern the texts in set (ii):

[22] Prat's transcription, but see **7.6.d** below for the new reading of **merto**.
[23] See the discussion of this practice in **13.3**.

CIL 62. The reading **merto** is almost certainly incorrect: read rather **merto | d**, on which see Wachter *Altlat. Inschr.* §86. The form could be salvaged as a "set (ii)" form only by claiming that the D was added later; but this would be a difficult assumption, in view of the probable form **Pel | t** in the same inscription, and the fact that this "overhanging" disposition corresponds to an early format attested with certainty as such, and not clearly associated with later corrections (see the discussion of this layout-type in **13.4** below).

CIL 45. In view of the "dialectal" features (dat. **Diana**, cf. also **Paperia** 'Papīria'), it is not clear why Prat allowed this inscription to enter his corpus, according to his stated criteria; cf. on CIL 386/388 below.

CIL 384. Despite Prat's wish to include this inscription in his earlier group, the upright N and L, and the generally modern look of the lettering, suggest extreme caution; cf. Wachter (*Altlat. Inschr.* §201d): "Die Buchstabenformen sind im Vergleich zu dieser orthographischen Altertümlichkeit erstaunlich modern, was einmal mehr zur Vorsicht bei der Datierung von Inschriften aufgrund solcher Kriterien mahnt (wobei hier die Buchstabenformen massgebender sind, denn Namen neigen zu archaisierender Wiedergabe)." Indeed, the form **Apolene**, with the more recent short-vowel inflection (vs. older **Apolon-**, see Chapter **9** below on this distinction), is not supportive of an earlier dating.

CIL 386/388. These inscriptions are from Marsian territory, and 388 at least shows clear "dialectal" features (**vecos** etc.). The possibility that relatively early "Auslautschwund" might be a dialectal characteristic (which Prat acknowledges elsewhere, cf. **7.8.b** below) considerably weakens the value of examples such as these.[24] Note also G in 388 (**Magio**), which brings the absolute chronology down to at least the mid-third century.[25]

---

[24] Compare Porzio Gernia's topographical analysis of *d*-loss, according to which "L'umbro è evidentemente il centro di questa innovazione" (*M e D* 176). For more on "Auslautschwund" in CIL 388, see also **13.4.a**.

[25] For a detailed discussion of "Die Erfindung des Buchstabens G", see now Wachter *Altlat. Inschr.* §§138-142 (pp. 324ff.).

CIL 28. In view of **Populicio** (line 4), the *-ol-* of **Aescolapio** is clearly archaizing (and not genuinely archaic), cf. here also **Ae-** vs. *Ai-* (Wachter *Altlat. Inschr.* §149j).

7.6.e For the items in set (iii):

CIL 360. On the discrepancy here between modern letter forms (especially upright N) and archaizing orthography, see Wachter *Altlat. Inschr.* §181 (and cf. above on CIL 384).

CIL 1696. Prat seems here to have improperly (according to his stated procedure) dipped into the later part of CIL (i.e. inscriptions after CIL 620). In this case, it would have been advisable to follow his usual practice, since the inscription cannot be dated before 200 (see Wachter *Altlat. Inschr.* §197b on **ae** beside **ai**, **-um**, etc.).

CIL 27. Neither photographs nor facsimiles of this inscription are available, depriving us of the possibility of evaluating the relative chronology on the basis of letter forms.[26] As the above discussion should have made clear, this latter type of evidence has been almost entirely neglected by Prat, thereby further weakening his claims concerning relative chronology.[27] Without this form of control, however, Prat's reliance on spelling practices is methodologically problematic, as any number of examples might show. Thus, while Prat in general makes much of *o*-stem nom. sg. *-os* vs. *-us*, the latter happens to be attested remarkably early — cf. Wachter *Altlat. Inschr.* §131, citing CIL 565 (3rd c.) **Silanus**,

[26] Indeed, the published transcriptions are partly contradictory: CIL (p. 387) prints **Aescolapio** with open square P, vs. CIL VI 30843 (p. 3023) with (closed rounded) P, while both give angled L. (Degrassi *ILLRP* 38 omits the line division between **C.Bruttius** and **Aescolapio.**)

[27] The reference to "le modernisme de l'écriture" of CIL 2440 (*Ablatif* 51, cf. **7.4.b** above) apparently refers to spelling, and not paleographical details concerning letter forms. For an instance where Prat does refer (although vaguely and incorrectly) to letter forms and direction of writing, see **7.7.c** below.

and late-third-century examples are not difficult to find: e.g. 608/609 **M.Claudius** (211 B.C.), 610 **C.Aurilius** (200 B.C.), both from Rome.[28]

7.6.f Among relevant third-/second-century inscriptions not considered by Prat, despite their availability in CIL or in other collections (esp. Degrassi *ILLRP* and Warmington *Remains*), the following are worthy of note in relation to the above discussion:

(i) CIL 976[29]

Coronicei
T.Terentius.L.C.l.donom.
mereto.dedet

Despite the features **-om/meret-/dedet**, which would place this inscription in Prat's archaic set (ii) (cf. here also **mereto** without *-d*), note also **-ius**, as well as upright N (2x), beside inclined N (1x) and (slightly) angled L.[30] Note also the unusual word order **donom | mereto.dedet**, which allows for the possibility that **mereto(d)** has not been spelled with *-d* because of a purely orthographic convention related to the following initial *d-* (cf. **1.6.a** above on CIL 1 **kapia(d):d-**).

(ii) CIL 2675a[31]

Turp.Orcio.P.f
Hercole.dono
dat.lubes.merto

---

[28] For the general problem, see Wachter's analysis of the deceptively archaic-looking spellings of the later Scipionic elogia CIL 8/9 (*Altlat. Inschr.* §§125ff.); here note also (n. 726) his instructive example CIL 1722 (from about 63 B.C.), which gives the impression of being more archaic than CIL 626 (from about 142 B.C.).

[29] Pp. 574 (with partial photo), 964 (Rome); Degrassi *ILLRP* 70, Warmington *Remains* p. 78, Wachter *Altlat. Inschr.* §213c; more recently also Peruzzi *Pesaro* 149f.

[30] Peruzzi's evaluation ("paleografia ... molto antica") is based on less reliable criteria (i.e. the forms of O and R).

[31] Pp. 832, 863 (found in Sabine territory, but origin uncertain); Degrassi *ILLRP* 150 (*Imagines* 65), Wachter *Altlat. Inschr.* §194b.

In general, this (probably third-century) inscription[32] is remarkably similar to CIL 62, not only in the style of its lettering (for 62, see Degrassi *Imagines* 70), but also in its orthographic and phraseological features (**Hercole, mert-, dono | dat.lub-**), except that here **merto** contrasts with 62 **merto | d** (cf. **7.6.d** above).

(iii) CIL 2867[33]: I leave aside the complex problems related to the proper disposition of the two pieces of this (probably late-third-century) text (see CIL for discussion), and therefore forego a full transcription.[34] The form **mereto**, at the bottom right of one of the pieces, appears to be complete (the edge is worn, but apparently not broken), and appears together with **dedet**, but also **libes** (not **lub-**). Note also (despite Prat's claims about the diagnostic value of **meret-** vs. **merit-**, in association with other allegedly archaic variants, **7.6.b** above) **]n̥ere** beside the surprisingly modern **]a̯f()luc** (not **louc**) in CIL 2869 (cf. n. 34).

(iv) CIL 1531 ("Dedicatio Vertuleiorum", near Sora; Saturnians): here **mereto** beside **lubetes**; but this text is not likely to be much earlier than 150 B.C. Note already **donu** with *-u*, nom. pl. **leibereis** (cf. **8.3.d** below), not to mention other consistently *d*-less ablatives (**voto.hoc | solut[o]**,[35] **[de]cuma.facta | poloucta**), and the artificial **danunt** characteristic of early poetry.[36]

---

[32] Note CIL p. 863 incorrectly P (for open P), N (for inclined N), and R (for R with short tail), as is clear from the photograph.

[33] P. 876 (Ager Capen.); Degrassi *ILLRP* 93a (*Imagines* 42a,b), Wachter *Altlat. Inschr.* §203b, Peruzzi *Pesaro* 107.

[34] Here note Wachter's mistaken transcription **a[f].luc(o)** for Torelli's **a[f.luc(o)]**, whence Wachter's comments on his inability to see **luc** in the photograph; compare, however, 2869 **]n̥o |]a̯f()luc |]n̥ere** (with inclined N, angled L, and "short R"), in the same series, discussed at **6.4.c**; cf. also below, after **7.6.f** (v).

[35] But see **7.8.d** below on the hiatus in **voto.hoc**.

[36] The old notion that this formation (in its well-attested version *-ĭnunt: redĭnunt, prodĭnunt, obĭnunt*, cf. also *nequĭnunt*) is an inherited archaism comparable to Li. *einù*, Hitt. *iyannai-* (cf. Leumann *LLuF* 514) continues to be promulgated (e.g. Ivanov, *Slav. ... glagol* 65), but is unlikely to be correct. Such a theory fails to account for the artificial distribution of these forms (3pl. only, early poetry and glosses), which suggests rather a kunstsprachlich prosodic adjustment first involving *danunt* (the best-attested form), of the sort (roughly) *damus/datis/dant* > (isosyllabic) *damus/datis/"dan̥t"* (i.e *danunt*, cf. e.g. *fīmus/fītis/fiunt*), whence (by metanalysis of *danunt* as *da-nunt*, cf. *da-mus, da-tis*) *-ĭmus/-ĭtis/"-ĭ-nunt"*, also *explēnunt* (P.F. 70.3 L).

(v) Degrassi's restoration **[merit]o** (*ILLRP* 119), in the third-century altar fragment now published as CIL 2838,[37] is regarded as certain (and therefore significant, given the age of the text) by Porzio Gernia (*M e D* 174). But the situation is not so clear-cut; the text reads as follows:

]i̯o.M.f
]o̯le
]o̯.eios
]no
[------]

Interestingly, Degrassi's CIL transcription now adds a query to the *merito* previously conjectured for line 3:

[---]io(s) M.f.
[Herc]ole
[merit(?)]o eios
[---do]no
[dat]

Indeed, the indentation patterns discussed in **3.3.c-f** suggest that **[Herc]o̯le** in such a format would have been indented by one or more characters (cf. 2675a = (ii) above, and the still lengthier indentation of 2869a, cited in **3.3.e**); thus **[merit]** (or **[meret]**) alone is probably insufficient for the opening of line 3. Depending on the length of the missing onomastic material in line 1, **[dat.meret]** or even **[dedit.meret]** would be more satisfactory in this respect. It is difficult, however, to see how to construe **eios** in such a sequence, and the indentation facts also make it possible for e.g. **[dat.meretod]** to appear in the last (missing) line, which would produce a far more natural pattern (**[do]no | [dat.meretod]**), assuming the restoration **[do]no** to be correct. The third-century **[meret]o** of line 3, then, is in fact quite uncertain, although a

[37] P. 862 (Rome), photo tab. 3 fig. 3; cf. Wachter *Altlat. Inschr.* n. 814.

d-less ablative of some other sort (cf. e.g. CIL 755 **eius.studio**) remains a possibility.

Among more recently-published material, finally, may be noted the new exemplars of third-century dedications from the Lucus Feroniae,[38] both of which show **merito** (not **mereto**) beside **lub-**.

7.7 *Adverbs in -ē*

7.7.a Prat attempts to provide a further argmnent in favor of an archaic *d*-less Latin instrumental on the basis of adverbs in *-ē* (*Ablatif* 63ff.). As Prat observes, the problem is complicated by the question as to whether these Latin formations in *-ē* and (partly) *-ēd* (CIL 365 **rected** etc., to be discussed below) continue old thematic instrumentals in *-ē* (< **-e-h₁*) to which an "ablatival" *-d* has been added secondarily (thus e.g. Ernout *Morph. hist.* 30), or rather an inherited apophonic variant *"*-ēd"* of the thematic ablative desinence **-ōd* (thus e.g. Leumann *LLuF* 411, 426, Buck *Comp. Gr.* 181, 349). In spite of a number of arguments that render, in my view, the instrumental analysis more attractive,[39] the problem is moot for present purposes, since either assumption can in principle account for the attested Latin situation (i.e. primarily *-ē*, with some archaic attestations of *-ēd*), unless it can be shown that early inscriptional data (i.e. those that might precede the general loss of final *-d*) uniformly show *-ē*, while early instances of **-ed** can be explained secondarily.

7.7.b There are again problems with the selection of data: since CIL 581 (SCdeBacch) is excluded, the form **facilumed** (as also **suprad**, **exstrad**) plays no part in the discussion, although (oddly enough, despite the strictures against the use of "dialectal" material) Prat makes use of CIL 364b **sai[pi]sume** and **[be]ne** (in a text with acknowledged Faliscan coloring),[40] and attempts to integrate even Fal. **foied** into his findings (cf. **7.7.i** below). On the basis of very slender evidence, then, largely

---

[38] *AE* (1985) 378a,b, cf. **7.6.f** (iii) and **6.4.c**.

[39] On Lat. *-ē* (beside *-ō*) as an old instrumental see now also Beekes *Origins* 179, cf. consonant-stem gen. sg. **-es ~ *-os*.

[40] Cf. also **7.7.f** on the alleged date of this text.

involving several controversial forms in the Praenestine bronze inscription CIL 560, Prat finds an old "adverbial *-ē*", and no support for *-ēd*, apart from CIL 365 **rected** (another "Faliscoid" text), explained away as a hyper-archaism from the later period of *d*-loss, or as due to "influence sabellique".

7.7.c While Prat's conception of an early instrumental *-ē* may be correct (cf. **7.7.a**), the evidence is considerably shakier than he acknowledges. Particularly difficult are the forms drawn from the well-known Praenestine bronze CIL 560 (cf. Prat *Ablatif* 63f.), engraved with images of cooks and/or servers at work, with accompanying culinary text.

In view of the two *d*-less adverbs **sane** and **recte** Prat finds in this text, which he takes to be the earliest containing such forms, he attempts to support an early dating: "une écriture ancienne" (otherwise unspecified in nature), and the fact that some lines are written left-to-right and others right-to-left, are taken to justify a mid-third-century dating (*Ablatif* 64). But both points are specious: there is nothing in the details of the lettering to confirm such a dating,[41] and the direction of writing is determined according to entirely different principles than those Prat seems to have in mind.[42] Indeed, the form **cofeci**, already with **<-i>** for expected **<-ei>**, suggests a rather later dating, even if Wachter is correct in explaining this as a "contrastive spelling" influenced by the preceding /ē/ (*Altlat. Inschr.* §67d).

7.7.d Even granting the earlier dating, neither the form **recte** (in a sequence **madent()recte**, in the version preferred by Prat)[43] nor the form **recie** 'rēgiē' (in the alternative version **made()mi()recie**)[44] can stand: as Wachter's rendering (from autopsy) now makes clear, the line in question

[41] The consistent (with the possible exception of the problematic first word) and relatively large closed O's produce a modern impression, if anything (see Wachter's rendering from autopsy, *Altlat. Inschr.* §67).

[42] For Matthies' "Linksläufigkeitsregel", see in general Wachter *Altlat. Inschr.* §44b, and §67a for its observance in this inscription.

[43] Thus e.g. Ernout *Recueil* 57 ("lecture douteuse"), Ve 367i, Pisani *Lingue* 156 etal.

[44] Thus e.g. Warmington *Remains* p. 198, cf. Conway *Dialects* 322 (after Duvau) **madent()recie.**

reads **made()mirecie**,[45] the interpretation of which is quite obscure, and need not involve an adverb in *-ē* (cf. Vetter ad loc.: "*mademirecie*, was keinen Sinn gibt").

7.7.e More promising is the form **sane**, in the phrase **misc.sane**,[46] generally taken simply as 'misc(ē) sānē', with the colloquial usage (imper. + *sānē*) familiar from Plautus and Terence ('Go ahead and mix it!').[47] Especially in view of the form **porod** (in a parallel imperative phrase **feri.porod**), the contrast *-ē* vs. *-ōd* may well be significant, and has been taken as such by Wachter (*Altlat. Inschr.* n. 695). But **porod** is itself partly obscure: if this is the adv. 'porrō', as is generally assumed, and if this is a Greek loan (cf. Att. πόρρω, and further e.g. Frisk *GEW* s.v. πόρσω), the *-d* must be secondary in any case (see Prat *Ablatif* 65f. and Wachter *Altlat. Inschr.* §67e for discussion).[48] The alternative interpretation of **porod** as 'with a leek' (Warmington), although rejected by Wachter and ridiculed by Prat,[49] need not be dismissed out of hand: Apicius[50] provides not only recipes involving pounded leeks (II.3.1, also III.20.4 in a sauce to be used with fish, cf. CIL 560 **piscim**), but also various instructions to crush, cook, mix, stir (et al. imperatives) various ingredients or mixtures with stalks or shoots (ablatives, often without *cum*): thus IV.2.14,15 *fistula percuties* 'pierce (it) with a reed (stalk)', X.2.9 *agitabis rutae surculo* 'stir it with a shoot of rue', and even VIII.2.8 *agitabis porro et satureia* 'stir (it) with leek and savory'.[51] It may be worth noting, however, that among the

---

[45] As, in fact, had often been correctly noted hitherto — cf. MADE MIRECIE in Warmington's apparatus, similarly Conway *made mire cie*, etc.

[46] On **misc** see further **14.4.c** below.

[47] Somewhat differently CIL p. 904, glossing as 'totum', comparing Ital. *sano* = *intero* and Umbr. **sanes** 'sanis' (IV 8); but see below (with n. 59) on the latter.

[48] Wachter's attempts to find inner-Latin explanations for *porrō* (cf. §2 of the "Introduction") are not persuasive: his **por-tro* (cf. *citrō, ultrō* etc.) is phonologically difficult, and also suffers from a problem shown by his second alternative (*por* extended artificially to *porrō* after *crēbrō, rārō, sērō* etc.), namely that "*por*" has no independent existence in Latin outside of verbal compounds: *por(ri)gō, porriciō, portendō* etc. (perhaps rather **pṛ-*, cf. Umbr. *purdouitu* etc.).

[49] Wachter *Altlat. Inschr.* n. 895 (discussing CIL 2847 **poro**); Prat *Ablatif* 66 n. 2 ("Passons sous silence la curieuse interprétation ... ").

[50] Numeration and text after Milham, but see notes 51, 56 below.

[51] Also VII.6.8 *agitabis satureia et porro*. In view of this construction, the emended text of Giarratano-Vollmer at VIII.1.5 (*agitas cepae et rutae fasciculo*) may be preferable to the MS version (*cepam/fasciculos* EV) generally printed (Marsili, Milham, André[2]).

great variety of verbs used to describe actions of pounding and the like in the preparation of food (generally *tundo, tudiclo, battuo,* similarly *frico, (con)tero,* etc.),[52] the rather violent verb *ferio* does not seem to be used. One might also imagine, then, an entirely different interpretation: **feri** could in theory reflect the expected 2sg. imperat. **fere* to *ferō,* with the *ĕlĭ* orthographic confusion otherwise well-attested for this period.[53] The injunction 'Bring it forth!' would then nicely prefigure the final statement **asom.fero.**[54]

But even **sane** may be susceptible of another interpretation. In view of the occasional non-notation of dialectal palatalized *-n-* (of the type Pael. *Ptruna* [Ve 215q = CIL 3246], *Licina* [CIL 3257]),[55] not to mention the somewhat unorthodox expression of the instruction itself,[56] one might also consider whether **sane** could reflect a form of Lat. *saniēs.* Although this word generally designates such unappetizing liquids as '(diseased) blood, venomous slaver, pus, dye (from the purple-fish)' etc., it seems also to have been a *terminus technicus* used in association with *amurca* 'the lees of olives',[57] and once even refers to the most prized form of *garum* (fish sauce), the Roman culinary staple.[58] A similar interpretation might also be considered for the Umbrian hapax **sanes** (IV 8), in the asyndetic phrase **supes:sanes** generally taken to mean 'extis sanis', i.e. 'integris'.[59]

---

[52] Similarly also in Catonian preparations, e.g. *Agr.* 125 *contundito.*

[53] CIL 8 **aidiles** (nom. sg.), 9 **hic/bec,** etc (cf. **3.2.a, 5.1.b, 14.4.g**). An actual raising in the second syllable might also be phonetically justified, whether via dissimilation, or as an intermediate stage in the reduction preceding the loss of this vowel, which would have happened soon after (there being no trace of **fere* in Plautus, unlike *dīce* etc.).

[54] Compare *infero* 'serve' in Apicius, and esp. the formulaic recipe-final *et inferes* 'and serve'.

[55] Cf. **12.3** below, and also **12.2.b** on palatalized velars in CIL 60 (early Praen.).

[56] Cf. Cato *Agr.* 75 (bis), 85, 87 *(per)misceto bene,* 76 *bene conmisceto,* 106 *misceto probe,* Apic. I.5 *permisce* (v.l., Giarr.-Vollm.; *promisce* EV, Mars./Milh./Andr.) *diligenter,* VI.9.13 *assidue agitas,* etc.

[57] Plin. *Nat.* 15.9 (*Oliva constat nucleo, oleo, carne, amurca. Sanies haec ...*), cf. Col. *R.R.* 1.6.24 (*oleis expressa amurcae sanies*).

[58] Manil. 5.671 (*Hinc sanies pretiosa fluit ...*), cf. in general Apic. V.1.1 *cum iure misces.*

[59] See Ernout *Dialecte* 95 s.v. *sano-,* and more recently esp. C. Watkins, in Milner *Langues* 208ff., esp. 213f. (= *IE Studs. 2,* 332ff., 341f.). Despite Watkins' otherwise persuasive arguments in favor of a meaning 'intact', with **sanes** as an epithet of **supes,** the construction of the passage seems also to allow for an asyndetic coupling with two nouns. Thus **supes:sanes** could mean something like 'with entrails (and their) drippings' (surely a good candidate for a traditional alliterative phrase), if the formation and spelling of **sanes** could be justified. The non-notation of expected **-i-** could perhaps be influenced by

7.7.f As for the "Faliscan cooks" dedication (CIL 364, with **sai[pi]sume, [be]ne**, cf. **7.7.b** above), Prat again suggests a third-century dating; but this cannot be correct, as noted by Flobert (op. cit. 368), and as now argued in more detail by Wachter (*Altlat. Inschr.* §204f): numerous features (spelling with geminatio vocalium, ligatured -NT, etc.) demonstrate that the inscription is not likely to be earlier than about 150 B.C. (thus also Porzio Gernia *M e D* 175, following Vetter), in which case the *d*-less spellings <-e> are without value for Prat's thesis.[60]

7.7.g As with **meretod** etc., Prat again omits data of potential interest. The early inscription CIL 2868[61] appears to contain the unusual phraseological variant **dono.merite**, with an adverbial *meritē* that Prat might have added to his list of early forms of this type without *-d*. But even if the traditional reading **merite** is correct (more on which shortly), the form would not be probative: the probable late-third-century dating (cf. here already **-ius**) allows for an explanation via *d*-loss. In fact, the reading **merite** seems to me problematic. Note first that the right edge of the inscription is broken, although only a small fragment must be missing, in view of the symmetrical construction of the piece (a triangular "frons aediculae"), and the roughly symmetrical layout of the text (despite the rather crude differences in letter sizes).[62] Moreover, what appears to be a vertical stroke directly following **merite** (i.e. directly before this small break) is clearly visible in the photographs,[63] which could well (if this is

supes (if this was a traditional pairing), together with the analogy of the regular palatalization of *-n-* in the sequence/-ini-/, with frequent non-notation of the second **-i-** (of the type **spinia** IIa 36 vs. **spina** IIa 38 etc., cf. Meiser *Lautgesch.* 199).

[60] For additional references to other scholars favoring a (mid- to late-) second-century dating (L. R. Taylor "saec. II", Peruzzi "ca. 130"), see CIL p. 877.

[61] P. 876 (Ager Capen.); Degrassi *ILLRP* 93b (*Imagines* 41), Wachter *Altlat. Inschr.* §203b, cf. **7.6.f** above for the contemporaneous inscription CIL 2867, from the same votive series to Feronia.

[62] The broken right edge (unlike the broken left edge) is misleadingly not notated in the published transcriptions, although this fact is explicitly noted by the original editors (R. Bloch and G. Foti, *RPh* 27 [1953] 71) and by Degrassi *ILLRP* ad loc., and is clear in any case from the photographs.

[63] The original photo in *RPh* 27 (1953) Fig. 4 is somewhat clearer on this point than Degrassi's.

not a chance abrasion) reflect the left half of a D. The correct reading, then, might after all be **meritedi[**.

Also of interest is the possible adv. **costę** 'caste' (?) in CIL 393 (Marsian territory), but the form (like the rest of the inscription) is problematic in several ways (cf. **3.3.j**).

7.7.h In contrast, Prat's literary (as opposed to inscriptional) omission may provide some evidence for a relatively early form with *-d*. Although Prat, as usual, duly considers literary (i.e. metrical) evidence for this adverbial category from Plautus, Saturnian poets, and other early dramatic literature (*Ablatif* 242ff., 427f., 432ff.), he omits mention of the interesting (and, to my knowledge, unique) instance in which an adverb in *-ēd* may be transmitted as such (or almost as such) in the literary tradition: Ennius *Ann.* 358 Sk (= V 365) is transmitted in the form *alte delata petrisque ingentibus tecta* (P.F. 226.14 L), which Mueller plausibly restored as *alted elata* ... (cf. Leumann *LLuF* 426).[64]

7.7.i The evidence outside Latin (cf. Osc. *amprufid* [Ve 2], πεhεδ [Ve 183] etc., and Prat *Ablatif* 63: "L'osque n'est pas le latin") requires only brief comment here. Even if Prat (*Ablatif* 65) is correct in trying to explain away the *-d* of Fal. **foied** (Ve 244), he omits consideration of the possible **pramed** (beside **pramod**) in Ve 242A (Archaic Faliscan!), where part of the joke (?) may depend on this contrast (cf. Giacomelli *Lingua fal.* p. 45, and more recently Eichner "Reklameiamben" 216).[65]

It seems also necessary to reckon with adverbial *-ēd* in South Picene, on which see Meiser "Pälignisch" 120 (AP 2 *qupírih* beside AQ 2 *quprí* < **kuprēd*). Thus, despite Lat. **sane** beside **porod**, the extension of abl. *-d* not only beyond the thematic declension (as in both early Lat. and Osc.)[66] but also to the thematic instrumental could have been both extremely early and very widespread.

---

[64] Skutsch, who prints *alte delata...*, asserts without explanation that the archaism *alted* is "not credible"; he nevertheless agrees that *delata* itself is problematic (see his discussion, *Annals* ad loc., p. 524).

[65] Note also Fal. **ifra** 'infra' (Giacomelli *Lingua fal.* 88), cf. **CIL 581 suprad, exstrad.**

[66] Cf. also Meiser loc. cit. on SPi. *arítih* (AP 2) < (abl. sg.) **artīd*, and further Eichner "Pietas" 196 (with n. 7) on AP 2 *ímih*, as well as AQ 1 *homanah* (perhaps abl. *-*ād*) and *puqloh* (cf. **3.4.f** n. 101).

7.8 *Other Inscriptional Data*

7.8.a Objections similar to those advanced above, *mutatis mutandis*, could be raised against various other locative/instrumental usages in which Prat finds evidence for significantly old *d*-less forms.

For locative ablatives without *-d*, Prat alleges the following four instances (*Ablatif* 52ff.):

(i) CIL 364a **in.Sardinia** — but this is of no value for the chronological reasons already noted (**7.7.f** above);

(ii) CIL 5 **en()urbid.Casontonia** — but apart from Prat's unconvincing attempt to defend the Latinity of this Marsian-Latin text, the **-a** of **Casontonia** is itself squeezed *in margine* between lines 5 and 6 (despite Prat's transcription, but clear from the facsimile he reproduces, cf. also **13.4.a** below), such that the absence of final *-d* here cannot be taken as significant (thus correctly e.g. Porzio Gernia *M e D* 172);

(iii) CIL 614 (189 B.C.) **in.turri.Lascutana, ea.tempestate** — but since this is from a time when *d*-loss was already well-advanced, it is too late to be probative, as Prat himself admits;

(iv) CIL 366 (Lex Spolet.) **quo.die** (beside **eod.die**) — see next section.

7.8.b The last-mentioned example is only one of several allegedly significant cases (of various kinds) drawn from CIL 366.[67] But the clear dialectal (specifically Umbrian) traits of this text should have rendered it unusable for Prat's purposes, especially in view of the following statement (*Ablatif* 68 n. 2): "Le latin archaïque des inscriptions a ... subi des influences sabelliques contradictoires: — tantôt celle de l'osque qui généralise le *-d* ablatif ... — *tantôt celle de l'ombrien qui l'amuit (cippe de Spolète rédigé sur le territoire ombrien)*" [italics mine — BV]. Moreover, Prat's early dating of this text (*Ablatif* 26, 48: "peu après 241") is again

---

[67] Cf. **7.5.c** above; further *Ablatif* 44 (**dolo.malo**), 46f. (**advorsnm.ead**), 48 (**rei. dinai.cau[s]a** [sic, cf. **13.5.c** with n. 23), 61f. (**die**). (In the last-mentioned discussion [p. 62], Prat incorrectly states that **die** is so spelled consistently in both versions of the text; but the "copy" once reads **died**, see e.g. Wachter *Altlat. Inschr.* §§199b-d.)

highly improbable in any case, on which see now Wachter *Altlat. Inschr.* §199f, following Leumann *LLuF* 68 (early 2nd c.), and further **12.1.d** below.[68]

7.8.c Prat tentatively adds the "cas-limite" usage in CIL 383 **aire.moltaticod** (*Ablatif* 45f., 57) as a significant early instance of a source-ablative with *-d*, but properly admits that this is inconclusive, since the case interpretation is ambiguous between instrumental ("by means of fine revenue") and source ("out of the fine revenue"). In any event, consideration of the remaining evidence would have indicated considerable fluctuation, of the sort that is consistent simply with the ongoing *d*-loss for the period in question: in addition to CIL 383, also early CIL 3151 **aired.moltaticod**,[69] 2675c **moltaticod**,[70] vs. later 1496 **aere. multatico**, 2442 **moltatico**, cf. 1513 **aere | Martio**.

7.8.d The inscriptional evidence, then, provides no clear support for Prat's theory. It would be all the more surprising if the Plautine statistics on hiatus were any more encouraging, especially in view of Prat's admission that by the time of Plautus, the original distribution he hypothesizes had largely broken down. Indeed, the metrical/statistical part of the study is also, in my view, inconclusive at best (similarly Flobert, op. cit. 368f.), but consideration of such problems would take us too far afield. There is, however, no objection to the theory that early metrical practice with regard to ablatives in hiatus is at least partly conditioned by relatively recent pronunciations with /-d/, and this principle may have inscriptional (as well as strictly literary) applications for some early poetic texts. Thus, despite some uncertainties about elision and hiatus in Saturnians,[71] the half-line **voto.hoc | solut[o]** in CIL 1531 (cf. **7.6.f** above) should perhaps be

---

[68] The later dating accords well with Monteil's explanation (op. cit. 165f.) of the odd spelling **ead** as a hypercorrect archaism (extended to acc. *eā*, cf. *intereā* etc.), in view of fluctuating spellings (in this period shortly after *d*-loss) with and without *-d*. Prat's conception of **advorsum.ead** as showing a real ablative with archaic "valeur d'origine" (hence the spelling with *-d*) must be judged, with Monteil, "totalement invraisemblable".

[69] Previously accessible in Mello-Voza *ILP* 140.

[70] Degrassi *ILLRP* 45 (*Imagines* 26, left half only).

[71] See e.g. Cole "Saturnian" 42f. (here note esp. Naevius 3.1 M *in templo Anchisa*), and more recently Radke *Arch. Lat.* 58 with n. 37; cf. also Kazanskij's reconstruction of a Saturnian from Livy 6.29.9 ("Nadpis'" 165ff.), with hiatus at the central caesura.

considered a hexasyllable with hiatus (cf. *in templo Anchisa* etc., Cole p. 34) rather than a pentasyllable (as Cole takes it, p. 40), cf. Cole's analysis (p. 41) of the half-line **asper(e).afleicta** (with hiatus) in the same poem.[72] And despite the relatively advanced date of CIL 632 (generally thought to be a mid-second-century composition, at the earliest), a similar approach might be applicable to the metrically problematic sequence **pro.usu[r]a.hoc** in the second line of the hexameter dedication, which reads **moribus.antiqueis.pro.usu[r]a.hoc.dare.sese.** Unless one wishes to operate with emendation,[73] one could perhaps simply scan *pr(o)⏑ usura(d) hoc* (i.e. with elided *pr(o) ⏑us-*, but with "ablative-licensed" hiatus before *hoc*, as a metrical archaism), thereby removing at least the metrical difficulty.[74]

[72] Thus indirectly attesting **asper(ed)** (?); **asper(a)** has also been suggested.

[73] Thus Mommsen's **promiserat** for **pro.usu[r]a** (accepted by Ernout *Recueil* 130, among others), or Ritschl's **hoc.<quod>**, etc. (see CIL pp. 507, 922 for details concerning both the metrical and interpretive problems); but the engraving technique is very precise (see Degrassi *Imagines* 71).

[74] This would not be the only rather marked metrical archaism in this text: note also monosyllabic **suo** and **tua** in the following line (cf. CIL 1861 **soveis**, Enn. *Ann.* 214 Sk *suos* etc.; Skutsch *Annals* 382 n. 8) and trisyllabic **facilia** (i.e. syncopated *fac(i)lia*) in the line after that (cf. Enn. *Ann.* 511 Sk *cap(i)tibus*, later e.g. Juv. 3.263 *strig(i)libus*, see Courtney *Commentary* ad loc.).

CHAPTER EIGHT

The o-stem Nom. Pl. in -e(i)s

8.1 *Introductory*
8.2 *Pronominal* **eis, heis** *etc. (I)*
8.3 *Distribution of (Nominal) -e(i)s Forms*
8.4 *Inner-Latin Explanations*
8.5 *-e(i)s as Inherited*
8.6 *Theories of Dialectal Origin*
8.7 *A New Dialectal Source*
8.8 *Excursus: Notes on the South Picene Inscription TE 2*
8.9 *-e(i)s and Non-urban Gentilicia: Further Considerations*
8.10 *Pronominal* **eis, heis** *etc. (II)*

8.1 *Introductory*

8.1.a The existence of an *o*-stem nom. pl. desinence with pleonastic *-s*, variously spelled **-es, -eis** (later also **-is**) in Republican inscriptions (as in the frequent titular term **magistres/magistreis**), is well known (see e.g. Leumann *LLuF* 427, Sommer *Hdbch.* 346f., Ernout *Morph. hist.* 31f.), although the origin of this formation remains obscure.[1] Essentially three forms of explanation have been offered (plus various combinations of these), as follows:

(i) ***-e(i)s*** is a Latin innovation, with a final *-s* added to the regular *o*-stem ending (OL **-ei/-e**, later *-ī*) on the analogy of the consonant-stem nom. pl. desinences (third declension *-ēs* etc.);[2]

(ii) ***-e(i)s*** is an inherited archaism;[3]

---

[1] Leumann (loc. cit.): "Eine überzeugende Herleitung für *-eis* fehlt".
[2] E.g. Leumann, Sommer, Buck, Palmer, Wachter/Risch (references in **8.4.a** below).
[3] Haudry, Jiménez Zamudio (references in **8.5** below).

(iii) the final *-s-* of ***-e(i)s*** is due to dialectal influence, cf. Osc. *o*-stem nom. pl. **-ús**/*-us*.[4]

8.1.b Versions (i) and (iii) have numerous adherents, and either could lay claim to representing the "standard explanation" of this form. Nevertheless, there are certain characteristic — and therefore potentially revealing — details of the attestation and distribution of the forms in question that are consistently ignored by all attempts to explain them. After first considering the special status of the pronominal forms (**eis, heis** etc.) (**8.2**), and then the salient distributional facts of the nominal **-eis** forms (**8.3**), the inadequacies of the traditional accounts will emerge with more clarity, in separate examinations of the three approaches just outlined, together with several of their variants (**8.4-8.6**). A proposal concerning a new dialectal source for the nominal **-eis** forms (**8.7**) is followed (after an Excursus in **8.8**) by some further considerations raised by this new source (**8.9**), and by final remarks on the pronominal forms (**8.10**).

8.2 *Pronominal **eis, heis** etc. (I)*

8.2.a Pronominal forms of the type **eis, heis** etc. are generally considered in tandem with the nominal forms (**magistre(i)s** etc.), as might seem justified by the frequent collocation **heisce.magistre(i)s**. But there are several facts that distinguish forms like **heis(ce)** from forms like **magistreis**, suggesting that they need not (and perhaps should not) be considered on exactly the same footing. Hence, after briefly noting these facts, more detailed consideration of **heis** etc. will be postposed until **8.10** below.

First, it is a significant (if rarely noted) fact of orthography that while spellings like **magistres** are common (further details in **8.3** below), spellings like ****es, **hes** etc. are never found.[5] This point is of some importance in evaluating one of the theories that takes **-eis** to be an archaism, as will be seen in **8.5.a** below.

---

[4] E.g. Ernout, Pisani, Giacomelli (references in **8.6** below).

[5] The status of CIL 2675c **esdem** is somewhat different, on which see **8.10.b** below.

8.2.b A second significant deviation vis-à-vis the nominal forms is that pronominal (nom. pl.) *hīsce, illīsce* etc. are securely attested in literary sources (and explicitly noted in the Latin grammatical tradition: II.593.5 K [Priscian]), while inscriptional **magistre(i)s** and the like have no literary parallels or descendants at all.[6] Thus one can provisionally claim (in common with similar conceptions to be noted below) that forms like (epigraphic only) nominal **magistre(i)s** etc. — totally unattested in literary texts — are somehow artificial (hence their textual restrictedness), while pronominal **heis** etc. (although perhaps originally partaking of the same artificiality) managed to penetrate, in however short-lived and limited a way (further details in **8.10** below), into other forms of writing, if not also actual speech.

8.3 *Distribution of (Nominal) -e(i)s Forms*

8.3.a The distribution of the nominal **-e(i)s** forms is extremely limited, in ways that no previous analysis explicitly or implicitly accounts for. The most salient fact is that the majority of forms are onomastic in nature, of which several sub-types can be distinguished:

(i.A) names of persons: *gentilicia* — e.g. CIL 584 (Sent. Minuc.) **Minucieis**, 993 **Vesuies**, 2397 **Roscieis**, and numerous others, of which further instances will be cited in **8.3.b** directly below. This is by far the most frequent naming-usage in which **-e(i)s** is found.

(i.B) names of persons: *cognomina* — e.g. CIL 584 (Sent. Minuc.) **Rufeis**, 1469 **Pontanes.**

(ii) names of groups of people: e.g. CIL 584 (Sent. Minuc.) **Vituries/Veituris, Cavaturine(i)s, Mentovines.**

---

[6] Against Ritschl's attempts to find some nominal forms in Plautus (thus *Mil.* 374 *hisce oculi ecfodiri* [Lindsay, Ernout], but AB[1] *oculis,* P *fodiri,* whence *hisce oculis* in some earlier editions [Ribbeck, Tyrrell]), see Sommer *Hdbch.* 347; similarly Lindsay *Lat. Lang.* 399 ("probably never in the Nom. Pl. of O-stem nouns").

Although attested with certainty, types (i.B) and (ii) are considerably more rare than the gentilicia type (i.A).

8.3.b As already noted by Ernout in his pioneering study of this formation ("Parler" 343ff.), the gentilicia in **-e(i)s** generally refer to precisely two individuals; the following list (which includes some material recently published in CIL I^2 fasc. 4, further corroborating the pattern) indicates the nature (and frequency) of this feature:[7]

Q.M.Minucieis CIL 584 (Sent. Minuc.)
Sex.Q.Vesuies 993
L.L.Alfieis 1236
M.P.Vertuleieis 1531
P.L.Freis 1612
L.P.Modięs 1850
L.L.Orbieis 2252
C.L.Tossieis 2323
M.P.Roscieis 2397
Cn.M.Vinucieis 2541a
L.C.Memies app. 269
L.L.Caecileis 3004b (cf. 3004a **[L.L.C]aecileis**)
L.P.Spdies 3425

Much more rarely, a sequence of three individuals is found: thus **Cn.Cn.Cn.Septumieis** 1382, **P.Ti.Sex.Herennieis** 1814.[8]

The frequency of the "two-individual" pattern led Ernout to consider this common behavior of **-e(i)s** to show a kind of "pseudo-dual" usage, of which he found traces in other forms beyond strictly onomastic ones (to be considered directly below, in **8.3.c**). It can be objected, of course, that not all forms (onomastic or otherwise) occur with two individuals (as just seen), and that *pairs* of brothers or other family members are likely to be a frequent occurrence in any case, as long as a plural form of a name is used; it was presumably considerations like these that led to Sommer's explicit

[7] This list is probably nearly complete for materials from the Republican period.
[8] Several items with broken or incomplete contexts are omitted, as for example CIL 3061]**Popilies**[, 3488 **Valerieis**, *Epigraphica* 45 (1983) 130f. **Sertorieis**.

rejection of the pertinence of Ernout's observation, at least in its strong form, in one of the rare instances in which the point has been noted at all.[9] But Sommer seems to have overgeneralized Ernout's observation, which did not claim that **-e(i)s** was *restricted* to this function; and it cannot be denied, in any event, that the onomastic occurrences of **-e(i)s** — which constitute, once again, the most frequent attestation of this ending (lexically speaking, i.e. apart from the frequently-occurring word **maglstre(i)s**) — are in fact *largely* restricted to precisely this format, which may well be a fact of some importance, as will be suggested below.

8.3.c The second main class of forms in which **-e(i)s** is prominently attested consists of titles, occupations, and other designations of status, of which **magistre(i)s/magistris** is by far the most frequent representative.[10] Similarly also **ministris** 681, **duomvires** 1511, **[cosc]riptes** 611; **violaries, rosaries, coronaries** 980, **coques** 1447, **fabres** 1448, **tonaries** (or **topiaries**[11]) 1457, **lanieis** 3064; **serveis** 1510, **libertis** 1236, **liberteis** 2131a.

Ernout attempted to integrate these forms as well into his conception of **-e(i)s** as a "pseudo-dual", citing such relatively early instances as CIL 364a **magistreis | L.Latrius.K.f.Salv[e]na.Voltai.f** (mid-2nd c.), among the earlier attestations of **magistreis** (apparently the first with spelling **-eis**, as opposed to **-es**),[12] as well as later examples (e.g. 1236 **Hilarus | et.Prothumus | libertis**). But here the pattern is somewhat less clear than for the gentilicia: cf. already CIL 2661 (171 B.C.), with three (not two) **macistres.**

8.3.d Several other less obviously "titular" nouns are also attested, but still within a similarly formal semantic range, and sometimes in association with gentilicium in **-e(i)s**: thus for the latter, nom. pl. **leibereis** in CIL 1531, following **M.P.Vertuleieis**, in a dedicatory poem in Saturnians, much like the formal dedication 1236 **L.L.Alfieis** ...

---

[9] "Mit Unrecht sucht Ernout ... eine Beschränkung auf dualischen Gebrauch zu erkennen" (*Hdbch.* 347).

[10] E.g. CIL 364a, 675, 677, 1447, 1898, 2239-40, 2261, 2270, 3065, 3068.

[11] See Wachter *Altlat. Inschr.* §951 for this suggestion.

[12] On this point see Wachter *Altlat. Inschr.* §110a with n. 668.

libertis. In a similar way, nom. pl. **vireis** at 583.14 (Lex Repetund.) is associated with several other **-e(i)s** forms, to be discussed in the next section.

8.3.e Also rare, and not attested until the Gracchan period, is the use of nom. pl. **-e(i)s** in adjectives and participles, which Ernout (no doubt rightly) took to be an extension from the nominal usage. Again, the contexts in which these forms occur are mainly legal/judicial, or otherwise solemn; the appearance of several such forms in both CIL 583 (Lex Repetund.) and CIL 585 (Lex Agr.) is particularly striking, since both documents survive on alternate sides of one and the same bronze tablet.

Certain patterns and correspondences are visible in the legal attestations, some of which endow the **-e(i)s** forms with a certain secondary character, although this is difficult to specify with precision. Thus it may not be coincidental that the nom. pl. adj. **publiceis** (585.29) appears in a relative clause, with antecedent (abl. pl.) **agreis (in.agreis ... quei ... publiceis.populi.Ro[mani.fuerunt])**, and that a similar structure appears in the phrase with participial nom. pl. **facteis** (585.28 **censoribus.quei.quomque.facteis.erunt**), which happens to occur in the preceding line. Moreover, the pattern with future perfect (and relative clause) seen in the last example is strikingly similar to the instance of nom. pl. **vireis** (alluded to in **8.3.d** above) at 583.14 (Lex Repetund.): **[eorum.quei.ex]h.l.CDL.vireis.in.eum.annum.lectei.erunt**; here, however, the secondary nature of **vireis** emerges from parallel phraseology with normal nom. pl. in **-ei** (thus 583.21 **ex.eis.quei. ex.h.l.CDL.vire[i].in.eum.annum.lectei.erunt**), and also (somewhat like the association with abl. in **agreis ... publiceis** above) from phraseological parallels with ablative (thus 583.15 **de.CDL.vireis**, and esp. 583.20 **de.CDL.vireis.quei.in.eum.annum.ex.h.l.lectei.erunt**).

Somewhat different, but also suggestive, is the final "participial" instance (**gnateis**), at CIL 583.77 (Lex Repetund.): **nepotesque.[t]um. eiei.filio.gnateis.ceiveis.Romanei.iustei.sunto** 'and the grandsons then born to that son shall be full Roman citizens'. Here what is particularly interesting is the linear organization of the sentence. The nom. pl. in **-eis**, by avoiding assonance with the preceding dat. **eiei** and the following nom. pl. forms in **-ei** in the predicate phrase — and also by

assonating with its clause-initial referent **nepotes** — helps to demarcate more clearly the phrase **nepotes ... gnateis**; this is then more transparently juxtaposed, with a kind of linking assonance, to the immediately following predicate nominative phrase, beginning with **ceiveis**.[13]

8.3.f At least two adjectives in **-eis** are attested besides **publiceis**, but in somewhat later texts, and likewise in formal (in this case religious) contexts: CIL 1486 (Tibur) **lapides.profaneis.intus.sacrum**;[14] and (once) **mustae pieis** (CIL 665, Samothrace) in the recurring term of religious office generally attested as **mustae/mystae piei** (CIL 667, 671, 2505, 2941 etc.) in the *tituli mystarum Samothracici*.

Ernout himself had aptly characterized the stylistic level occupied by most of the "dual" forms in terms of "la langue diplomatique et juridique"; the semantic and stylistic range of all of the other nominal forms (including the few adjectives and participles) is likewise severely restricted, and in much the same way.

8.4 *Inner-Latin Explanations*

8.4.a As already noted (**8.1.a** above), the Latin-internal account of *-e(i)s* (there listed as version (i)) is widely accepted, and is found in most of the standard handbooks.[15] These various statements are virtually identical, except in the matter of whether the analogy is based on the third declension only, or whether influence from the fourth and fifth declensions is envisaged as well. This distinction, however, does not materially affect the general weakness of the theory: in either case, the mere appeal to nom. pl. *-ēs(/-ūs)*, without further elaboration, is incapable of explaining any of the salient facts (and perhaps especially the onomastic ones) about the distribution of the *-e(i)s* forms, as described above.

---

[13] 583.14 **scriptes** (see the apparatus to tabula B, CIL p. 447) is generally corrected, no doubt rightly, to **scriptos**, although the error may be related to the existence of a possible nom. pl. form **scripteis** (like **facteis, gnateis**).

[14] On this phraseology see now A. Valvo, *Aevum* 61 (1987) 113ff.

[15] Leumann *LLuF* 427, Sommer *Hdbch.* 346f. (following Solmsen), Buck *Comp. Gr.* 182, Palmer *Lat. Lang.* 243; as an option in Monteil *Éléments* 163, Blümel *Untersuch.* 58.

8.4.b The most detailed account along these lines is presented by Wachter (*Altlat. Inschr.* §100a),[16] who operates on the premise that the attested allomorphy (*o*-stem nom. pl.) **-ei/-e/-i/-es/-eis/-is** "ist gleichzeitig ein lautliches, morphologisches und orthographisches Problem". Wachter notes, first of all, the probable phonetic similarity between (a) the early (and also, in some cases, dialectal) monophthongized stage -*ę̄* of nom. pl. *-ei* (< **-oi*), as in CIL 5 **socie**, 9 **ploirume** etc.,[17] and (b) consonant-stem nom. pl. forms in **-es**, and especially their alternants with suppressed or reduced final *-s*, as in CIL 389 **Pisaurese**, and perhaps 2442 **aidile** (if this is plural, see Wachter *Altlat. Inschr.* §178a).[18] On this basis, *-s* could then have been added as a kind of supplementary plural marker to *o*-stem nominatives, perhaps beginning with pronouns (cf. the early literary forms, Plt. *hisce* etc.), starting from "quasi-inlautenden" cases like **esdem/eisdem** for *īdem* (cf. the frequent formula *"idem probaverunt"*). Wachter notes, moreover, that such inscriptional spellings with final **-s** might not actually reflect a real pronunciation, but rather — at least partly — "eine graphische Massnalune zur Verdeutlichung der Kasusform".

8.4.c This conception, while attractive in many respects, does not address some of the key problems posed by these forms, and is partly contradicted (or at least weakened) by certain of the facts of attestation. As for the nouns: Wachter himself notes that the *s*-less forms of the consonant-stem nom. pl. are relatively uncommon, and also found in areas where Auslautschwund is otherwise a general feature (note especially CIL 389 **Pisaurese**).[19] It would seem, then, that hypercharacterized *o*-stem nominatives in **-es** might be expected originally to have spread from such areas; but this cannot be shown for the early **-es** examples, which, as Wachter again notes, seem to reflect the oldest examples of *o*-stem forms

---

[16] Wachter attributes some of the details of his formulation to Risch (n. 667).

[17] For **magistre(i)s**, note esp. CIL 59 (early Praen.) **magistere**, 1926 (Cingulum) **magister** | **ę** (cf. **4.7**).

[18] For the phenomenon, cf. also CIL 2659 **plebe** (nom. sg.), 480 **Statia** (if gen. sg. in *-ās;* for this interpretation see Wachter *Altlat. Inschr.* §150e), 500 **atica** (vs. 499 **atigas**), etc.

[19] For extended discussion of Auslautschwund in Pisauran Latin see now Peruzzi *Pesaro* Ch. XVII ("Declinazione pesarese", 173ff.).

with final *-s*. This latter fact, moreover, causes difficulty for the assumption that the hypercharacterization began with pronouns: apart from the rare **esdem** (CIL 2675c), the pronominal forms are generally attested as **eisdem/heisce** etc., and most such cases need not be as old as the early layer of nominal forms in **-es** (cf. **8.5.b** below on **eis**). Finally, there is no explicit account, in Wachter's formulation, for the early pseudo-dual value of **-es/-eis** in onomastic expressions.

8.5 *-e(i)s as Inherited*

8.5.a The two most recent explanations of Lat. nom. pl. **-e(i)s** have both sought to justify the Latin material on the basis of inherited archaisms.

For J. Haudry (*Homm. Schilling* 481f.), the solution for Lat. *-e(i)s* depends on the rigorous formulation of analogical explanations (on which see in general 477f.). Nevertheless, his account of *-e(i)s* is singularly unclear. At first, he refers to the ending *-e(i)s* ("notée aussi *-es*") in pronouns and substantives as an "innovation éphémère": after accounting (in a more or less conventional way) for the ordinary nom. pl. masc. **-oi* on the basis of "pression syntagmatique" involving phrases like **toi uirōs* > **toi uiroi* (with an accompanying proportional analogy acc. **t-ōns* : nom. **t-oi* :: **uir-ōns* : x; x = **uir-oi*), he concludes that "[i]l est probable que l'innovation qui a conduit à *-eis* a suivi le même chemin", resulting in "une seconde flexion pronominale notamment pour *is:* N. Pl. *eis*, G. Pl. *eum*, D. Abl. Pl. *ībus*", although he does not specify just how (or when!) these forms came into existence. He continues, however, as follows: "Ce N. Pl. *eis* en face de *eī* a une certaine antiquité: il se superpose comme **eyes* au gotique *eis*. C'est de là que procède la forme *heis* et, par pression syntagmatique, l'extension de cette désinence à l'adjectif et au substantif."

There is thus some uncertainty with regard to Haudry's position concerning *eis:* is it an "innovation éphémère" of relatively trivial analogical origin, or is it an inherited archaism, cognate with Go. *eis* (both < **eǰes*)? The latter hypothesis, at any rate, is unacceptable: an inherited **eǰes* would yield Lat. ***ēs* (cf. *trēs*, and especially nom. pl. **kʷeǰes* > CIL 581 **ques** [SCdeBacch]/OL *ques* [Cato]), a difficulty that has long been

clear.[20] Moreover, Haudry's conception of the spread of this feature (*eis* > *heis* > adjectives > substantives, "par pression syntagmatique") is flatly contradicted by the attested chronology and distribution of the forms in question (cf. **8.3** above), and fails to explain some of the salient facts of attestation, such as the early appearance of *-es* precisely in substantives (not pronouns or demonstratives), and the pervasive pseudo-dual usage with names and titles.

8.5.b It is worth noting more specifically that the form (nom. pl.) **eis** itself is not securely attested until relatively late. The oldest instance generally cited is the **eeis** of CIL 581 (SCdeBacch), line 4 (thus apparently with rather odd "geminatio" spelling, on which see in general Chapter **11** below). But Wachter (*Altlat. Inschr.* §122e) has convincingly argued that this form is better taken as dat. pl., in a construction much like that to be assumed for the (syntactically somewhat clearer, and normally spelled) dat. pl. **eeis** of line 25, which appears in similar phraseology and construction. Apart from this problematic early instance, then, nom. pl. **eis** is not attested, to my knowledge, until Gracchan-era (and later) legal texts: thus CIL 583.26, 27, 57, 67 (Lex Repetund.);[21] 582.16, 22 (Lex Bant.); and perhaps 584.29 (Sent. Minuc.).[22]

8.5.c According to R. Jiménez Zamudio (*Emerita* 56 [1988] 121ff.), Lat. *-e(i)s* reflects an inherited nom. pl. ending **-ōis* or **-ŏis*, described as a hypercharacterized version of (pronominal) **-oi*, to which a pluralizing *-s* has been added. For Jiménez Zamudio, then, the nom. pl. masc. of the

---

[20] Haudry's proposal thus seems to differ hardly at all from the account offered by Ernout (*Recueil* p. 64), according to whom the addition of *-s* in nom. pl. **eis** was favored by the presumed existence of an **ejes* > ***es** (unattested, but cf. **ques**), and then **eis** leads to **heisce** etc. (In view of the existence of archaic **ques**, the complete absence of a nom. pl. ***queis** seems particularly troubling for this account.) On the problem of the spelling **eis** (as opposed to ***es**) see also Blümel *Untersuch.* 58, 79.

[21] With 583.26 (**quei.ita.lectei.erunt.eis.in.eam.rem.ioudices.sunto**) and 27 (**quam.in.rem.eis.iudices.lectei.er[unt]**) cf. the patterns with **lectei.erunt** (583.14, 20, 21) discussed above (**8.3.e**), as well as the parallel with abl. in line 38 (**[ex.e]is.C.ioudices.L.lectei.erunt**); and for 583.57 **eis** in the sequence **quantei. eis.censuer[int].** note the use of **eis** (vs. **ei**) adjacent to a different case form in **-ei** (cf. **8.3.e** above on 583.77 **eiei ... gnateis**).

[22] But see **10.1.b** on this possible instance from the Sententia Minuciorum (text **eus**, perhaps cf. Osc. *ius-c*).

Indo-European thematic declension consisted of three parallel desinential "allomorphs" (originally, it seems, indifferently nominal or pronominal) **-oi*, **-ōs*, and **-ōis*/**-ois*. For the latter, however, there is no actual evidence, beyond Zamudio's conception (apparently following F. Villar Liébana) of a primordial nom. pl. masc. **tois* underlying pronominal forms like Skt. gen. pl. *téṣām* < **tois-ōm* (cf. OCS *těxŭ*), loc. pl. *téṣu* < **tois-u*, and the like. This conception is far from certain, to say the least; in effect, it merely transports the *explanandum* back to the protolanguage. But even granting the correctness of this reconstruction for some stage of (necessarily) pre-Proto-Indo-European, it is difficult to accept that vestiges of such an Ur-desinence (whose primary locus seems to have been pronominal) should have resurfaced in this relatively late Latin material (alone among Italic languages, where thematic nom. plurals are relatively well-attested) — Latin material which (it must again be stressed) involves a chronologically early layer of substantival forms at least as old as the pronominal ones, with a predilection for certain artificial-looking onomastic and titular attestation patterns.

Zamudio's attempt to support his analysis by demonstrating the existence of a nom. pl. **-ōs* in Latin is likewise unacceptable: it depends solely on the ambiguous forms of the type CIL 61 **Q.K.Cestio**, for which **-ōs* (while technically possible, cf. **8.4.b** above on **Pisaurese, plebe** etc.) is a particularly unlikely alternative. These (mostly non-urban) gentilicia almost certainly reflect nom. sg. forms, as is typical for such paired expressions outside Rome.[23]

8.5.d Somewhat similar to Jiménez Zamudio's approach is the conception of Monteil (*Éléments* 163), according to whom Lat. *-e(i)s* could reflect not an inherited IE desinence, but at least a relatively archaic Latin innovation, namely an "ancien *-ois*, qui peut ... provenir d'un croisement entre *-ōs* et *-oi*". But even if thematic **-ōs* survived into Latin (or "pre-Latin") long enough for such a contamination to have occurred (for which there is no evidence), the peculiarly restricted nature of the attested *-eis* forms would not thereby be explained, any more than with any of the other

[23] For further discussion of the **Q.K.Cestio** problem, with arguments in favor of the nom. sg. interpretation, see now Wachter *Altlat. Inschr.* §88b.

theories. One might also wonder (much as with other versions) why the predictable parallel development (*-*ās* X *-*ai* > **-*āis*/**-*ăis*) never transpired with feminine *ā*-stems.

8.6 *Theories of "Dialectal" Origin*

8.6.a The other popular method of accounting for Lat. *-e(i)s* is via dialectal influence (**8.1.a**, version (iii)). Thus Ernout, in an influential treatment (*Morph. hist.* 32, cf. already "Parler" 344), speaks of "une contamination entre *-*ei*, *-ī* du latin, et *-*ōs* avec *-s* final des autres dialectes italiques" (echoed, for example, in Meillet-Vendryes *Traité* 440), and similar formulations abound in the work of Italian scholars (cf. §2 of the "Introduction").[24]

8.6.b There are, however, serious difficulties with this approach, the precise assumptions of which have never been clear (cf. Leumann loc. cit.: "Einfluss von osk. nomin. pl. *-ōs* ist unwahrscheinlich", but without further explanation). Thus Blümel (*Untersuch.* 58) has aptly noted that even if one is prepared to grant the (otherwise rare) borrowing of a morpheme, one must here grant, for the comparison with Osc. *-ōs* (i.e. /-ūs/), the still more unlikely borrowing of *part* of a morpheme. Moreover, as with the versions by Jiménez Zamudio and Monteil (cf. **8.5.c-d** above), this approach fails to explain why *ā*-stems were not subject to similar sigmatic pressures (cf. Osc. **-as**/*-as*, Umbr. **-as**/*-ar*).[25]

8.6.c There is no explanatory advantage in deploying, as does Giacomelli (loc. cit.), sociolinguistic jargon referring to a "process of

---

[24] E.g. Pisani *Testi* p. 14 ("al nom. pl. in *-ei* ... è aggiunto *-s* per influsso dell'osco"); De Rosalia *Iscrizioni* 119, 133; Giacomelli *Graeca Ital.* 150 n. 7 (citing, together with *magistreis*, a non-existent form *coqueis*, presumably for CIL 1447 **coques**, these being forms which "attestano l'estensione ad altre categorie morfologiche di morfemi probabilmente osco-umbri caratteristici dei temi in *-i-*"); Petracco Sicardi "Sent. Minuc." 237; Lazzeroni "Geminatio" 132 with n. 2, "Contatti" 294.

[25] Despite frequent claims to the contrary, the Pisauran nom. pl. **matrona** (CIL 378, 379) does not strongly support the existence of a Lat. nom. pl. *-ā(s)*; see now Wachter *Altlat. Inschr.* §200c, §218e (following Blümel *Untersuch.* 46f.) with arguments for *-a(i)*, and more recently Peruzzi *Pesaro* 180ff., who allows for both possibilities.

interference in progress" etc., however chic this may be. In such a case, one would surely expect some clearer indications as to the source form(s), as well as a random or scattered distribution of the emerging *-e(i)s* forms. On the contrary, the nature of the *-e(i)s* data, as we have seen, is quite non-random in certain ways, and these patterns exhibit no apparent connection to any Osco-Umbrian plural source.

8.6.d Of some interest, to be sure, is the often-repeated claim that the nom. pl. *-e(i)s* forms show a certain predilection for appearing in non-urban locales,[26] or in texts in which other allegedly dialectal elements are often found, such as "geminatio vocalium" (cf. **5.2.a** above on "Delian Latin"). But it is important to consider the limitations of this sort of analysis, which have emerged more clearly thanks to Eska's recent study of purported substratum phonological features in Pompeiian Latin ("Pompeii"). Eska's findings were essentially negative: there is no good evidence that any such features are best explained by an appeal to substratum influence from Oscan phonology. In the same way, there is no *a priori* reason to assume that what appears to be a distinctive morphological feature, even if it can be localized in "dialectal" terms, has a direct morphological source in some non-urban dialect (cf. §2 of the "Introduction"). As has already appeared to some extent above (cf. **4.3** on Campanian paleographic features) and as will become clearer below (Chapters **11-16**), the clearest "substratum" effects in Archaic Latin inscriptions are tied more or less directly with distinctive orthographic traits, these often being correlated with onomastic expressions; nor should this be surprising, since onomastic material provides a natural and efficient vector for the importation and subsequent dispersal of foreign orthographies or other associated forms of expression. It is from this perspective that the alternative dialectal source of at least some of the *-e(i)s* material is offered in the next section.

---

[26] Thus already Ernout "Parler" 344: "À Capoue, le nominatif en *-eis* est de règle dans les formes *magistreis ..., ministris*"; in much more detail Lazzeroni "Contatti" 294 ("epicentro nel Lazio meridionale e nella Campania"), with concise topographical survey of attestations.

8.7 *A New Dialectal Source*

8.7.a We have seen that, apart from the frequent form **magistre(i)s**, the nominal **-e(i)s** forms are predominantly attested as gentilicia, generally with two praenomina (i.e. the "pseudo-dual" usage identified by Ernout). Recalling Wachter's apt observation that such a problem, although hitherto generally considered in purely morphological terms, has a strictly orthographic component as well, one should thus investigate the existence of orthographic practices specifically associated with naming expressions. Nevertheless, normal urban spellings have nothing comparable; and since the **-eis** forms do indeed, as shown most clearly by Lazzeroni, have a relatively clear dialectal profile in terms of their attestation patterns — including, one might add, some clear Oscan and/or Paelignian correspondences[27] — one is led to consider the orthography of gentilicia in Oscan, Paelignian, and other non-urban traditions, where a striking comparandum can in fact be found. It will be convenient to begin with the Oscan and Paelignian data.

8.7.b As is well known,[28] Oscan/Paelignian gentilicia are formed in essentially the same way as Latin ones, i.e. with suffixal **-io-*; a significant difference, however, is that there is a "long form" of the suffix (roughly "**-iio-*"[29]), beside the familiar shorter form.[30] Moreover, in Oscan — the only non-urban speech form for which relatively abundant data are available — this "long form" of the gentilicium is far more common than the short form, occurring (according to Lejeune's statistics) in about 70% of the expressions with gentilicium.[31] Beside short form *-is*/**-is**/-ις, the

---

[27] E.g. **Alfieis** 1236, cf. Pael. *Alafis* (Ve 216), Osc. (acc.) Αλαφιομ (Pocc 190); **Spdies** 3425, cf. Osc. (praen.) Σπεδις (Ve 190 etc., cf. Salomies *Vornamen* 108).

[28] See in general Rix "Ursprung" 718ff., 724f.; M. Lejeune, *Anthrop. osque* 114ff.; Prosdocimi "Studi 1980" 232ff.

[29] The complex problems surrounding the more remote background of this form (as well as certain synchronic phonological problems, cf. the next footnote) are immaterial for present purposes.

[30] For the phonological problems raised by this form, especially in conjunction with syncope processes, see Meiser *Lautgesch.* 62ff., and for Paelignian, also Jiménez Zamudio *Peligno* 145; somewhat differently Prosdocimi "Studi 1980" 239 with n. 8.

[31] This version is also fairly frequent in Paelignian (as noted specifically by Jiménez Zamudio *Peligno* 5 n. 1, with listing on pp. 144f.), although not quite to the same degree

"long form" has a distinct nom. sg. *-ies* in Paelignian and -ιες in South Oscan documents, while other Oscan texts show a marked degree of orthographic variation: the spellings *-ies*, **-iis**, **-iís**, **-iíeís** are found with some frequency, beside rarer variants **-iieís**, **-íiis**, **-íís**.[32] I suggest, then, that the epigraphic Latin "plural" gentilicia of the type **Spdies**, **Alfieis**, **Minucieis** etc. actually reflect, at least in origin, such non-urban *singular* gentilicia spellings of the type just described, as abundantly attested in Oscan and Paelignian.

8.7.c Before considering certain details of the analysis, it is worthwhile pointing out that this "long form" extends well beyond Oscan proper and Paelignian, as noted, for example, by Rix ("titis" 180f.: "ein Nominativausgang *-ies* in den zentralapenninischen Dialekten häufig vorkommt").[33]

Although such naming data from Umbrian are sparse, the forms **Teteies** (Tab. Ig. Ib 45, IIa 44) and **Ufeřier/Ufeřie[r]** (Pocc 3/4) seem to provide forms of this type, as also Marruc. *Alies* (Ve 219), Volsc. *Cosuties, Tafanies* (Ve 222), Volsc. (?) *Pacuies* (Ve 223), Aequ. *Pomposiies* (Ve 226), Vest. *Ebdies, Pedlies* (Pocc 207).[34]

8.7.d There are also several suggestive candidates to be found in the South Picene documents. The following are almost certainly nom. sg., and are so taken by Marinetti (*Iscrizioni* ad locc.):

(i) *Apaes* (MC 1)/*Apais* (MC 2)[35]
(ii) *T/trebegies* (TE 5)[36]

---

shown by the Oscan corpus; the scantiness of the Paelignian data, however, precludes an accurate evaluation.

[32] F. Bader's recent discussion of Oscan-Paelignian *-ies*/-ιες (*BSL* 86 [1991] 123) makes no mention of this extreme variation. For the possibility of certain local preferences among the variants, see Buck *O-U Gramm.* p. 123.

[33] Similarly Coleman "Central Ital." (passim), who seems to view this as a general feature of most of the area covered in his survey.

[34] Cf. also **3.1.c** (ad fin.) for a possible "Sabine" example in CIL 2917c **Blaisiís**.

[35] On "Appius" and SPi. *apaio-* see Marinetti "Sudpiceno" 123 with n. 17; on the structure of MC 1: Marinetti *Iscrizioni* 106f., cf. 153 on MC 2.

[36] On the structure of TE 5: Marinetti *Iscrizioni* 117ff., esp. 121 n. 77 for *trebegies*.

(iii) *Staties* (CH 1)[37]

Another such form may appear in *heries* (AP 6), but the context is too broken for the form to be interpreted.

The case interpretation of *alies* (or *Alies*) in TE 2, however, requires more detailed discussion, hence the following Excursus.

8.8 *Excursus: Notes on the South Picene Inscription TE 2*

8.8.a Although the inscription TE 2 is complete, its interpretation remains problematic; the text reads as follows, in Marinetti's final transcription (p. 208):

postin : viam : videtas : tetis : tokam : alies : esmen : vepses : vepelen[38]

Of the two possibilities for *alies* discussed by Marinetti (*Iscrizioni* 142ff.), namely gen. sg.[39] and nom. sg., the latter can be supported with reference to MC 1, an alliterative composition in the same style as TE 2, with which it also shares phraseological parallels; thus here *Tetis ... Alies* 'Titus Al(l)ius' (cf. Marruc. *V.Alies, Sa.Alies* [Ve 219]), with disjunctive ordering, would be parallel to MC 1 *Apaes ... Púpúnis.*[40] Indeed, the overriding organizational criterion in this text seems to be the three (or four, if the vowel-initial sequence is counted) consecutive alliterative pairings, i.e. *viam : videtam, tetis : tokam, alies : esmen, vepses : vepelen,* accounting for the entire text except for the first word.[41] In terms of

---

[37] On the structure of CH 1: Marinetti *Iscrizioni* 107ff.; cf. 111 specifically on *-es/-ies* in the sequence *uelaimes : staties* as probably reflecting a typical binomial onomastic expression with "nome individuale" and "appositivo".

[38] There is a potentially significant indeterminacy in the reading, to be discussed in **8.8.b** below.

[39] Thus Meiser "Pälignisch" 115.

[40] On the disjunctive pattern see also Prosdocimi "Studi 1980" 244, comparing AP 3 *Apúnis : qupat : a[...] : [...] : [n]íṛ* with MC 1 *Apaes : qupat[: e]sm n : Púpúnis : níṛ;* further C. Watkins on the disjunctive pattern *mefiín ... vepetí* in MC 1 (with extra-Italic comparanda), *Lg.* 65 (1989) 797.

[41] On alliterative structures in South Picene see esp. Marinetti "Sudpiceno" 153ff. and *Iscrizioni* 85ff., Meiser "Pälignisch" 123 n. 95, Eichner "Pietas" passim.

syntax, then, one might well expect to find not only disjunct *Tetis ... Alies*, but other disjunctions as well.

8.8.b The crux of the matter, in a sense, is the central word *tokam* 'tomba [vel sim.]',[42] evidently acc. sg., as Marinetti assumes. This would seem to require a finite transitive verb form, which Marinetti takes to be *videtas* 'vedete/vedesti/vedeste'. An equally straightforward morphological interpretation of the form, however, would be to take it as a participle, identical in formation to Umbr. *(a)uirseto* 'visum'. This yields, for the opening sequence *postin : viam* 'lungo la via'[43] plus *videtas*, a semantically plausible phrase with a meaning like 'seen/visible from/along the road' (i.e. perhaps 'from afar'). Now the obvious referent for the participle, in such a case, would be the tomb or monument itself, i.e. *tokam*, and in fact this may be possible grammatically, in view of a possible indeterminacy about the reading of the last letter of (Marinetti's) *videtas*. Marinetti's preliminary transcription (p. 207) is actually *videta[-]*, with an accompanying note explaining that for the final letter, "La parte visibile è un segno angolare". Indeed, the facsimile (p. 204) and the photograph (Fig. 13) make clear that most of the letter space occupied by this character is damaged. But instead of Marinetti's restoration S, a restoration M — with the right-to-left form, as in the following *tokam* — might also be considered. Both this form, and the "vertical" orientation that would need to be assumed, could perhaps be justified on the basis of the character's positioning as the "pivotal" character at the top of the stone, at which the direction begins to change.

8.8.c With this alternate reading, the only remaining form that could be taken as a finite verb would be *vepses*, which has the appearance of being related to *vepet/l-* 'lapis, i.e. sepulcrum', and which then might mean 'sepelivit/struxit/caelavit/aedificavit' (etc.). If this form is taken to be 3sg. pf., and if (as already suggested by Marinetti) a verb of the sort *qupat/veiat* 'iacet' is to be supplied with the phrase *esmen ... vepelen*

---

[42] The reading *lokam* is also marginally possible, see Marinetti ad loc. On the etymology of *tokam* see further n. 44 below.

[43] On this interpretation see Marinetti *Iscrizioni* 142, followed by Meiser ("Pälignisch" 106).

(similarly MC 2 *Apais : Po[---]pú[-]es : l/uepetín : e{--}smín :* [sc. *qupat/veiat*]), one arrives at the following interpretation, which (predictably, cf. **8.8.a** above) involves a series of disjunctions:

postin : viam : videtaṃ : tetis : tokam : alies : esmen : vepses : vepelen
'longe visum/conspicuum T. cippum A. in-hoc struxit sepulcro [iacet]'

i.e. 'T. A. (hunc) cippum[44] longe visum (sibi) struxit/caelavit/
aedificavit[45] (idemque) in hoc sepulcro (iacet)'

While the formation of *vepses* as a perfect can be justified morphologically to a certain extent,[46] the interpretation as a 3sg. form is nevertheless difficult (cf. next section). It may be granted, in any case, that there are reasonable possibilities for a nom. sg. *Tetis ... Alies* of the type under discussion.

8.8.d Although it is tempting to take the sequence *vep- vep-* as a figura etymologica (even if the two words belong to different phrases, as above), this need not be the case.[47] An alternative analysis of *vepses* could be based on the following considerations:

---

[44] Marinetti (*Iscrizioni* 144 n. 93) plausibly takes *toka-* as equivalent to Lat. *toga*, thus *'covering' > 'tomb' (for <*k*> representing /g/, see Marinetti 52f., and further 104 on AQ 2 *rak*, although certain problems surrounding the notation of /g/ remain to be worked out definitively). Alternatively, since the diphthong *-ou-* is spelled inconsistently (apparently maintained in TE 7 *toúta*, RI 1 *toútaiḥ*, vs. monophthongization (?) in TE 5 *túta*, cf. Marinetti "Sudpiceno" 145ff. and Meiser "Pälignisch" 115), one might also envisage a form comparable to Umhr. *toce* 'publice' (Ve 237), with assimilation of the syncopated stem **totk-* > **tokk-* (Meiser *Lautgesch.* 285), thus a feminine substantivization **toutikā* 'public (monument)'.

[45] I.e. 'had (it) made/carved/built'

[46] For the stem-formation as an *s*-stem "primary denominative", cf. Osc. **upsed** for expected **op(e)s-ā-* (i.e. ***úpsatted** or the like). For the *s*-stem itself, cf. Gk. λέπας 'bare rock'. (See Marinetti, esp. 144, for other interpretations of the form.)

[47] "Wie im Päl. scheint auch im Südpik. ein engerer syntaktischer bzw. semantischer Zusammenhang zwischen allitterierenden Wörtern nicht notwendig" (Meiser "Pälignisch" 123 n. 95).

(i) The ending of *vepses* recalls Marinetti's original *videtaṣ*, which could well be taken as 2sg. (with *Titis ... Alies* therefore as gen.);[48] thus e.g. 'Procul vidisti/vides cippum/monumentum Titi Allii' for the first part;

(ii) the remaining sequence, with locative phrase *esmen ... vepelen* 'in hoc sepulcro', would thus appear to be syntactically independent from the first phrase, in which case it would require a finite verb, which could be *vepses;*

(iii) if *vepses* is the finite verb associated with the loc. phrase *esmen ... vepelen* (and in view of 2sg. *videtaṣ*), it would be most naturally taken as a 2sg. form related to SPi. *veiat* 'iacet, cubat,'[49] in the similar text MC 1 *[e]smín ... mefíṇ : veiat : vepetí* (with much the same alliterative sequence);

(iv) if the basis of *vepses* is **legh-*, then in morphological terms, *vepses* could be taken without substantial difficulty as a sigmatic future (i.e. the normal O.-U. type, cf. Umbr. *ostensendi* etc.), from a stem **legh-e-se/o-*;[50]

(v) once the post-syncope **lekse-* (cf. AQ 2 *opsút* etc.) underwent the change **l- > v-*,[51] the resulting **vekse-* need only have undergone a labial assimilation to give *vepses*.[52]

One arrives, then, at the following (perhaps not too far-fetched) alternative interpretation: 'Procul vidisti/vides [hoc] monumentum Titi Allii; [tu quoque] in hoc[53] sepulcro iacebis'.[54]

---

[48] On the problem of 2/3sg. *-si* in Umbrian, see the remarks on Volsc. (3sg. fut. II) *atahus*, **16.6.c** below.

[49] Roughly **legh-i̯ā-* (vs. e.g. Fal. **lecet** < **legh-e-* or **legh-ē-*), cf. Marinetti *Iscrizioni* 77, 107; Joseph and Wallace "Patois" 181 n. 37.

[50] Cf. Fal. **lecet** directly above, although it is noteworthy that this stem-form would differ from that supposed for *veiat*.

[51] The ordering of these two processes is not crucial for present purposes.

[52] This last development need not have been prevented by the present stem, in which the velar had itself disappeared; the result would simply have been a kind of suppletive system with pres. *veia-* beside fut. *vepse-*. Here note also that *-ks-* and *-ps-* are in some circumstances neutralized, as in the pre-Umbrian assimilation to *-ss-* undergone by both (Meiser *Lautgesch.* 169).

[53] I.e. *huiusmodi*.

[54] The sentiment is of course trivial: e.g. CIL 2138 **heus.tu.viator.las | se.qu[i].me.praete | reis | cum.diu.ambula | reis.tamen.hoc | veniundum. est.tibi**, 1836 **valebis.hospes.veive.tibi.iam.m[ors.venit]**.

8.9 *-e(i)s and Non-urban Gentilicia: Further Considerations*

8.9.a It is symptomatic, in view of the above hypothesis (**8.7**) concerning Lat. *-e(i)s* (i.e. actually *-ie(i)s* in the predominantly-attested gentilicia) and Osc. *-ies*, **-iis**, **-iís**, **-iíeís** etc., that modern scholars are uncertain as to whether some material should be interpreted as Oscan or Latin. This is especially easy to understand because of the existence of Oscan documents not only written in the Latin alphabet, but making use of Latin naming conventions, including patronymic notations with "f." (thus *]Mevies.C.f* Pocc 105.2), a pattern still more common in the Paelignian materials. Thus the expression *C.V.Ahies* (Ve 49 Anm.), apparently referring to two brothers, is taken by Vetter as Latin ("Lateinisch nach Alphabet und Sprache", hence with *Ahies* as plural, cf. Vetter p. 282),[55] by Lejeune (*Anthrop. osque* 18, 39) as Oscan (with *Ahies* as singular), and by R. Antonini and P. Miniero, in a detailed discussion of the problem (*SE* 53 [1985] 257f.), as Oscan (with *Ahies* as singular, but with patronymic expression, and not two praenomina).

Of particular interest is the ram's head tessera hospitalis CIL 23 **Atilies | Saranes.C.M.f**,[56] generally assumed to be Latin, and possibly also reflecting the earliest instances of the nom. pl. form in question (see Wachter n. 668), here spelled **-(i)es** in both a gentilicium and a cognomen. Nevertheless, the sequencing and form of this expression are decidedly odd;[57] CIL (p. 383) explains "Praenominibus omissis significantur quicunque descendunt a C. et M. Atiliis Sarranis", but Poccetti may be correct in his assumption that this text is to be conceived of rather as

---

[55] Here Vetter likewise takes Fal. **euios** (in the sequence apparently naming two brothers **euios;mamaẓẹxtos** Ve 241) as nom. pl., but this is far more likely nom. sg., as Giacomelli (*Lingua fal.* p. 135) seems to take it. (See **16.A.c** ad fin. on the punctuation in this sequence.)

[56] Pp. 383, 861 (origin unknown; 3rd c.); Wachter *Altlat. Inschr.* §215a, Pocc 203, Ernout *Recueil* 19, Degrassi *ILLRP* 1064 (*Imagines* 351).

[57] The other comparable early tessera hosp. CIL 1764 (in the form of a fish) transparently lists two individuals **T.Manlius.T.f** and **T.Staiodius.N.f**, with the word **hospes** in between.

Oscan, in which case *Atilies* and *Saranes* are singular.[58] In addition to the ambiguity occasioned by the use of Latin alphabet and patronymic with "f." (cf. Pocc 105, cited above), the spread of *-es* to a simple *o*-stem (i.e. in the cognomen) is also of interest (cf. CIL 1469 **Pontanes**).

8.9.b Two further points are worth noting with regard to spelling. First, it is possible that the great variety of notations (especially in Oscan) for the "long form" gentilicia endings (cf. **8.7.b**) may help account for the similar variety of Latin forms, sometimes within one and the same text (e.g. CIL 584 [Sent. Minuc.] **Minucieis/Rufeis/Cavaturineis** vs. **Vituries/Cavaturines** vs. **Veituris**). The earlier variant **-ies** (cf. Osc./Pael. *-ies*) would in any event have naturally been "updated" via spellings like **-ieis**, concomitant with its interpretation as nom. pl.[59]

Secondly, it should be recalled that Oscan/Paelignian *-ies* would partly have been spelled with cursive E, with the ending for gentilicia therefore appearing as **<-IIIS>**, while native Oscan **-iis** (the normal spelling) appears as **<-IIS>**. Especially in non-urban Latin contexts, i.e. in locales where the use of cursive E in Latin texts was widespread (cf. Chapter **15** below), such sequences would have been partly ambiguous, being liable to the interpretations **-ies/-eis** (for the first) and **-es** for the second.[60]

---

[58] For the latter, Poccetti compares Osc. **flakís** 'Flaccus' (Ve 163); on CIL 23 see further Antonini and Miniero op. cit. 258. In a purely Latin context, note also the new **Andies** (*AE* [1985] 450a; Aquileia, late 2nd/early 1st c.), which is unequivocally singular.

[59] I owe this last observation to Rex Wallace. It is less clear how to account for the spelling of CIL 3004 **Caecileis** (bis, cf. **8.3.b** above). CIL (p. 973) notes only "*Caecileis* pro *Caecilieis*", but the same spelling appears on both versions of the text, which are engraved in different hands, and contain several minor variations; the consistent **Caecileis**, then, is quite possibly significant. Perhaps this reflects a variant pronunciation with palatalized /l'/ instead of /li/. For a possible comparandum, note CIL 1202 **Caicilio**, in what appears to be a hexasyllabic Saturnian verse: since this verse would be the sole exception to the otherwise consistent preference of hexasyllables for either central caesura or caesura after the fourth syllable, Cole ("Saturnian" 39) is probably correct in assuming a trisyllabic scansion [- - -] for **Caicilio**, thereby yielding a normal pentasyllable verse type (for the scansion, cf. Enn. *Ann.* 286 Sk *Servilius* [trisyllabic], and Skutsch's discussion ad loc., *Annals* p. 462).

[60] Similarly Wachter *Altlat. Inschr.* §100a on the potential for graphic ambiguity, especially in *io*-formations.

8.9.c Finally, note that the transfer from non-Latin (sg.) gentilicia in *-ie(i)s* to Lat. *-ie(i)s* in the "pseudo-dual" function need not be conceived of as requiring a sole starting-point in actual "dual" expressions (as with two brothers), which are in fact rather poorly attested in the dialect material. What is well attested, however, are the two normal patronymic formats, namely the so-called "Oscan" type *A B C* = 'A B, C (f.)' (also Paelignian, e.g. *T.Valesies.L.* 'T. Valerius L. (f.)'), and the so-called "Umbrian" type *A B C* = 'A C, B (f.)' (also Volscian, e.g. *Ma:Ca:Tafanies* 'Ma(raeus) Tafanius C. (f.)', found also in Aequian and South Oscan).[61] Unlike standard Latin practice, neither format overtly marks the genitive with a word for "son", and thus both appear on the surface to contain precisely two nomina and a gentilicium. The "Umbrian" type in particular (which, as already indicated, was geographically far more widespread than this designation implies), i.e. "(nomen)*A* (nomen)*B* (gentil.)*C-ies* ", is identical to the Latin "dual" pattern **L.P.Spdies** etc. **(8.3.b)**.

8.10 *Pronominal **eis, heis** etc. (II)*

8.10.a The predominantly formal (i.e. mainly legal and dedicatory) nature of the onomastic **-e(i)s** forms contrasts markedly with more humble (and *s*-less) plural attestations, of the sort CIL 512 **Sex.M.Claudie** (on a lantern). The "artificiality" of the **-e(i)s** forms, then, is a function of what might be called their "honorific" function in designating public officials or others acting (or referred to) in a formal capacity or context. The early extension of this usage to cognomina and to other formally-named peoples (as in CIL 584 [Sent. Minuc.] **Rufeis, Vituries** etc.) is only to be expected, as is the extension to titles, occupations and the like (**magistre(i)s, duomvires, coques** etc.), as well as to other occasional forms encountered in legal or religious contexts **(8.3.c-f** above).

Especially in the case of titles, one might also allow for another sort of influence, namely from the prominent class of (consonant-stem) titular

---

[61] See Lejeune *Anthrop. osque* 45 on the status of the So. Osc. data with "Umbrian" format, and Lazzeroni's discussion of these cases, "Contatti" 284ff.

terms referring to (normally) paired officials, of the type *consules, aidiles, censores, praetores* etc., whence some pressure for (paired) **magistres, duomvires**, etc., as "honorific" versions.

8.10.b Similar developments may have occurred with some pronominal forms. Wachter's example CIL 2675c **esdem** (Rome, early-to-mid 2nd c., cf. **8.4.b-c** above) is instructive: here the pronoun appears (vis-à-vis e.g. CIL 62 [abl. pl.] **ede**, with the expected treatment for *-sd-*, cf. here also **sueq** 'suisque') not only "mit durch *-s* verdeutlichtem *e*, welches seinerseits das Monophthongierungsprodukt aus der Vorstufe **eei* darstellt" (Wachter *Altlat. Inschr.* §148h), but also in a formal context referring to *aediles curules:*

[...ai]diles.curules.moltaticod.dedere.esdem.probaverunt

As for **heisce** (which continues to be used until relatively late Republican times)[62] and the rarer **heis**[63] (never ***hes(ce)**): these might partly have been influenced by the frequent early **eisdem** (CIL 1471 etc.), cf. patterns of the sort **heisce.mag.hoc.opus | faciundum.couravere | eisdemque.probaver** (CIL 2949a.7-9). But the pervasive formulaic collocation with **magistre(i)s** itself (the most frequent of the titular **-e(i)s** forms) may also be of some importance: i.e. the "honorific" term **magistre(i)s**, once established (which must have happened relatively early), might naturally be expected to draw its accompanying ****heice** into the same morphological orbit, and indeed ****heice.magistre(i)s** is to my knowledge never attested. It is not unthinkable, moreover, that the form **heisce** might also have been partly motivated by avoidance of the homonymy between nom. pl. **heice** 'hī' and loc. **heice** 'hīc' that would naturally have arisen in the phrase ****heice.magistreis**: i.e., **heisce** would anchor the desired nominative interpretation in such an otherwise

[62] E.g. the recently-published CIL 2951a.16 ("Tabula Contrebiensis", 87 B.C.) **[mag]is[tr]atus.Contrebienses.heisce.fuerunt.**
[63] CIL 1319, 1347; see also **8.10.c** below for **his**.

ambiguous (and potentially more or less meaningful) phrase ('magistri [qui] hic [sunt]').[64]

8.10.c Whether or not the pluralizing *-s* of forms like **magistre(i)s** was artificial enough not to have been pronounced (as Wachter suggested, cf. **8.4.b** above), it would be difficult to make this claim for pronominal forms like **heis(ce)**: not only do these forms penetrate the literary language (as already noted), where they provide the comic poets with a convenient metrical alternant,[65] but the new late-Republican attestation of the phrase (nom. pl.) **eide his** in the "Getty" curse tablet (with the first secure instance of a nom. pl. spelled **his**, cf. **ministris** etc.) provides good evidence for such forms in actual use in the (late) first century.[66] Note also the contrast between the Capuan dedications CIL 677 with **heisce.magistreis** vs. 678 with **heisce.magistrei**, both from 106 B.C., similarly 2944 (Capua, 108 B.C.) **heisce.magistrei**. Nor is this surprising: it is, if anything, to be expected that the pronominal forms (as opposed to titles and the like), having lost any original "dual" tinge they may have had relatively early, would then have bleached out enough of the remaining "honorific" associations to acquire the status of alternants to normal *hī, īdem* (at least in certain limited contexts, as in the comic poets), and thereby to infiltrate the spoken language, if only to a small degree.

8.10.d But the "Getty" curse tablet, for all of its other popular indications,[67] is still a formal document; and even some of the Plautine attestations, especially in the phrase *hisce/illisce homines*, may show traces of the "honorific" or formal **heisce**, quite apart from the factor of sheer metrical exigency. Thus at *Most.* 935 (*quid illisce homines quaerunt apud aedis meas?*), *illisce homines* may have a humorous mock-formal ring for

---

[64] There is in any case no justification to be found for the view that **heisce**, Plt. *hisce/hibus* etc. continue old "*i*-stem" forms (thus e.g. Meillet-Vendryes *Traité* 497), even if this is the correct explanation for nom. sg. *hic* (cf. **3.1.i**).

[65] See e.g. Lindsay *Lat. Lang.* 399, *ELV* 170.

[66] For full discussion of this interesting text (*AE* [1988] 1146) see H. Solin, *Arctos* 22 (1988) 141ff.

[67] See Solin (op. cit.) on 3pl. **tabescat, placeat, placean**, the syncope in **domnis** (cf. **14.4.g** n. 39), *nōn* in prohibitions (**non placeat**), etc.

the audience ("those 'gentlemen'"), referring as it does to a pair of slaves (as the audience knows but the speaker does not), as also *hisce homines* at *Mil.* 486 (again referring to two slaves) and Ter. *Eun.* 268 (*nimirum hisce homines frigent,* uttered sarcastically or gloatingly); without *homines* but possibly with something stronger than a simple deictic reference is *hisce* at *Pseud.* 539 (*quid si hisce inter se consenserunt*), cf. P. Nixon's rendering (Loeb edition) "What if these rascals have got together...". Still clearer is Livy's typically archaizing usage (9.10.9): *A. Cornelius Arvina fetialis ita verba fecit: "quandoque hisce homines ..."* . If the above analysis is correct, this phraseology would actually be anachronistic for Livy's fourth-century speaker; Livy, of course, cannot know this, and merely (as we would expect in such a case) archaizes according to Augustan conventions and sensibilities, for which *hisce homines* was no doubt already dated and formal.

CHAPTER NINE

"Apollo"

9.1 *Apollōn- vs. Apollĕn-/Apollĭn-*
9.2 *"Apollō" and "homō"*
9.3 *Excursus: Latin humī and the Development of *m̥V in Latin and Italic*

9.1 *Apollōn- vs. Apollĕn-/Apollĭn-*

9.1.a Wachter has shown (*Altlat. Inschr.* §184a) that the name "Apollo" is first attested in a relatively widespread area with its expected Greek inflection (i.e. with *-ōn-* in oblique cases), as shown by a series of early inscriptions from the late third or early second century: CIL 37 **Apolones** (origin uncertain, but probably from Latium),[1] 59 **Apolon[e]** (Praeneste), 399 **Apolone** (Cales), 2873a **Aplone** (Lacus Fucinus).[2]

9.1.b In contrast, as Wachter shows, the innovating short-vowel inflection *Apollĕn-/Apollĭn-* appears not only in texts that are generally later (i.e. mainly second-century and later texts), but also in areas colonized relatively late, and therefore likely to show rather greater influence of urban Latin: thus **Apoline** CIL 1928 (Morrovalle in Picenum), 2219 (Sicily), 2628 (Veii), **Apolene** 384 (Mosciano in Picenum), **Apolenei** 368 (Pisaurum), **[Ap]olen[** 2894 and **[Apol]eni** 2895 (Ariminum).[3] According to Wachter, then, the interesting morphological replacement of *Apollōn-* by *Apollĕn-* (> *Apollĭn-*) is to be thought of as "eine von Rom ausgehende Eigenheit bzw. Neuerung ..., vermutlich in Analogie zu *Cupido,* einem ausserhalb Latiums m.W. nicht bezeugten Theonym".

---

[1] Erroneously printed Apolonos in Wachter's transcription of this text at *Altlat. Inschr.* §212a.
[2] I.e. probably **Ap(e)lone**, with syllabic notation, see further **9.2.a** and **14.4.g**.
[3] Note the "modern" form *-I* of the desinence in the last-cited form.

9.1.c There is no reason to doubt Wachter's theory that the new short-vowel inflection is essentially an urban feature; but the ascription of this development to the influence of *Cupido* is not entirely satisfying as an explanation — at least not as a complete account.[4] Of itself, the non-occurrence of *Cupido* outside Latium (where it is attested mainly on Praenestine mirrors) cannot be taken as significant, since this is (at least partly) a cultural fact that could in principle have a variety of explanations.

Indeed, there exist at least two other accounts (both based on Greek) for the short-vowel inflection of "Apollo", one or the other of which may have some validity, although each is individually at least as unsatisfying as the "Cupido" theory:

(i) According to Leumann (*LLuF* 457, following Meister), the short-vowel inflection *Apollĭn-* derives from **Apollŏn-*, itself generalized from the Gk. vocative ᾽Απολλον. Such a development cannot be excluded, and indeed something similar accounts for Thess. ᾽Απλουν, via a syncopated voc. *᾽Απελλον > *᾽Απλον (see A. Heubeck, *Glotta* 65 [1987] 181, after E. Fraenkel). It is unclear, however, why such a process would have taken place relatively late and in urban Latin only, with no trace, for example, in Oscan (consistently **Appelluneís** etc.).

(ii) Somewhat similar is Ernout's claim (*Morph. hist.* 47) that while **Apolon-** is simply "imitée du grec", the inflection *Apóllō/Apóllinis* arose "sans doute pour maintenir en latin la place du ton grec", cf. ᾽Απόλλωνος. Clear supporting examples are difficult to find, although the idea has a certain plausibility. By way of possible indirect support, one may note that the Latinized version of Gk. Λητώ (esp. Dor. Λᾱτώ) does not opt for the "obvious" inflection-type **Lā́tō/*Lātṓnis* (cf. *Iū́nō/Iūnṓnis*), much less a **Lā́tō/*Lā́tĭnis*, but rather the extended version with "native" *-ōna* (cf. *Bellōna, Annōna* etc.), which allows for fixed stress (*Lātṓna/Lātṓnae* etc.) on the same syllable that bears the acute in Gk. Λητώ/Λητόος, -οῦς etc.

In the absence, then, of an ironclad account of the replacement of *Apollōn-* by *Apollĭn-* — an event, after all, to which more than one

[4] As a given name, *Cupido* is in fact rare, cf. Solin *Namenpaare* 22 n. 45.

impulse may have contributed — there is some interest in adducing another possible factor that may help explain this otherwise unexpected development.

9.2 *"Apollō" and "homō"*

9.2.a Before proceeding, it is important to note that *Apollōn-* and *Apollĕn-/Apollĭn-* were not the only forms in use in Latin texts. The early **Aplone** of CIL 2873a already cited (**9.1.a**), from Marsian territory, almost certainly shows the Oscan form *"Apellōn-"* (not surprisingly, given the locale), spelled with syllabic notation.[5] Similarly, the form *Appellinem* [sic] (*Appellinem antiqui dicebant pro Apollinem,* P.F. 20.27 L) appears to be, as Wachter notes (n. 909), a "Mischbildung" based on the Oscan form, supplied with Latin inflection (and perhaps to be ascribed to Ennius).

We find, then, the following forms attested:

(i) *Apollōn-* (i.e. Ἀπόλλων, cf. Etr. *apulu*);[6]
(ii) *Apollĕn-/Apollĭn-;*
(iii) *Apellōn-* (i.e. Dor./NW Gk. etc. Ἀπέλλων,[7] as in Osc.);

and perhaps (iv) *Apellĭn-*, if the form is to be trusted, even if this is merely an artificial creation.

9.2.b It is a curious fact, perhaps not without interest in connection with the problem under discussion, that all of the forms for "Apollo" just listed can be paralleled with more or less contemporaneous forms belonging to *homō* 'human being', matching both root vocalism and stem-formation patterns; and secondly, it is precisely the stem-form *homin-* — with synchronic (although not necessarily historical) *o*-vocalism of the root, and the short-vowel form of the *n*-stem — that prevails, at about the

[5] Wachter (*Altlat. Inschr.* §186c) convincingly refutes the other possible interpretations (syncope, Etruscan influence). Note also that the Oscan material now includes T. Sironen's restoration **[App]**ḷḷiunís for Pocc 126 [..]lliunís (*SE* 56 [1989/1990] 461f. and *Arctos* 23 [1989] 191ff.).

[6] Perhaps originally Ionic (thus Wachter n. 909), from an area like Cumae.

[7] See in general W. Burkert, *RhM* 118 (1975) 1ff., Méndez Dosuna *Dialectos* 65ff.

same time *Apollin-* appears to have ousted *Apollōn-* (and possibly *Apellōn-* and *Apellin-*):

(i) *Apollōn-:* cf. *homōnem* (Enn. *Ann.* 125 Sk, Liv. Andr. 20 M, perhaps also 27 M, see Skutsch *Annals* ad loc., p. 278);[8] likewise Osc. (nom. pl.) **bumuns**, Umbr. (dat. pl.) *homonus.*

(ii) *Apollĕn-/Apollĭn-:* cf. Class. *homĭn-* (also (iii) and (iv) below for *nēmō*).

(iii) *Apellōn-:* cf. *hemonem* (P.F. 89.8 L), assuming *hemōnem;* despite some qualms arising from the unlikely form *hemona* in the first part of the gloss (*hemona humana, et hemonem hominem dicebant*), *hemonem* is widely (and in my view correctly) accepted as a genuine archaism (recently e.g. Nussbaum *Head and Horn* 187ff., with further references in 187 n. 61).[9] Note further that according to the traditional formulation of the so-called *o*-umlaut rule (*é* > *ó* before *o* in the next syllable, see e.g. Sommer-Pfister *Hdbch.* 94),[10] *hómō(nem)* (and *hóm(in-)*) could reflect a regular development of *hémō(nem).*[11] Schrijver, however, has recently (and in my view convincingly) proposed to reformulate this rule to apply only to *e* following **u̯, *m* and labiovelars (*Laryngeals* 466ff.), in which case Lat. *hom-* (as also the Osco-Umbrian forms) can no longer be explained via umlaut, and would seem to reflect a relatively old *o*-grade beside the *e*-grade of *hemonem.*

An *e*-grade root vocalism is also generally conjectured for Lat. *nēmō* (< **ne-hemō;* recently e.g. Bammesberger, *KZ* 98 [1985] 112), but there is no guarantee that *nēmō* cannot equally well derive from **ne-homō*[12] (see

---

[8] Maniet (*Phonétique* 68) sets up a hypothetical **ghomōn* for Latin (comparing Osc. **humuns**), without noting the actual existence of *homonem.*

[9] Similarly also Eichner ("Reklameiamben" 224 n. 34 §f), who apparently accepts *hemona* 'humana' as a genuine form; but see further **9.3.e** below for an alternative interpretation.

[10] The same rule is also generally assumed to have been operative in Osco-Umbrian (at least with intervening *-m-*), on the strength of Osc. **bumuns** and Umbr. *homonus.*

[11] Szemerényi (*Quellen* 48 n. 67, with further references) prefers to take *hemonem* ("wenn ... real") via dissimilation from *homon-.*

[12] Thus Szemerényi *Quellen* loc. cit., Schrijver op. cit. 468.

also on (iv) below). Cf. now also SPi. *nemúneí* 'nemini' (TE 5), with stem-form *-hVmōn-*, like Lat. *he/omōn-* and the Osco-Umbrian forms.[13]

As for the "hybrid" form (iv) *Apellin-*: this would be paralleled by the **-hemĭn-* underlying *nēmō*, according to the traditional interpretation.

Thus the innovatory *Apollin-* has prevailed over *Apollōn-* and *Apellōn-* (and perhaps *Apellin-*) just as Class. Lat. *homin-* prevailed over *homōn-* and *hemōn-* (and perhaps *-hemin-*). Moreover, to judge from the nature of the attestation of *hemonem*, and by the fact that *homōnem* is moribund already for Ennius and Livius (thus Enn. *Ann.* [Sk] 30 *homines*, 203 *hominum*, 307 *homines* etc.), these two parallel shifts were approximately contemporaneous. If, moreover, *Apollōn-* continues to be used into the early second century (cf. **9.1.a** above), it may be possible to date *he/omōn-* > *homin-* slightly earlier than *Ape/ollōn-* > *Apollin-*, although the inscriptional datings do not allow for certainty on this point.

9.2.c The precise import of these descriptive facts is not entirely clear. But since *homō* is one of only two plain *n*-stems referring to animates (the other being *virgō*), the parallel patterning with *Apollō* may be significant for understanding the derivational history behind the development *Apollōn-* > *Apollin-*, which therefore need not be ascribed solely to the influence of *Cupido*, or to prosodic effects related to the Greek source.

It may also be possible to correlate the *homō* facts with Wachter's idea that *Apollĭn-* is essentially an urban replacement of original (and partly rustic) *Apollōn-/Apellōn-*. In view of Osc. **humuns**/Umbr. *homonus*, early Lat. *hemōn-/homōn-* may also have had (or have developed) rustic associations, which would have been eliminated (or mitigated) by the replacement with the short-vowel stem *homĭn-*. The precise relationships, however, between *hemōn-/homōn-* on the one hand and the short-vowel stem **homen-* on the other remain unclear, although it is not impossible that both forms of the *n*-stem were inherited. Although this problem cannot be pursued in detail here, I conclude with an Excursus

[13] On SPi. *homanah* (AQ 1, cf. **7.7.i** n. 66) see **9.3.e** below.

on certain problems posed by the root vocalism of the related word *humus* 'earth', which will be seen to intersect in certain ways with the problem concerning *he/omōn- : *homen-* just mentioned.

9.3 *Excursus: Latin humī and the Development of *m̥V in Latin and Italic*

9.3.a The root vocalism of *humus* is clearly secondary, no doubt resulting from the sporadic *o* > *u* raising shown by *umerus* 'shoulder' (cf. Umbr. *onse/***uze**, Go. *ams* etc.)[14] and several other forms, as is generally agreed (see e.g. Sommer-Pfister *Hdbch.* 59, "*ŏ* > *ŭ* / __ *m*"). The resulting **hom-*, however, poses certain difficulties that seem to be insufficiently recognized, and that may have interesting consequences. If, as some assume (comparing Gk. χθόνιος 'of the earth' and similar forms), the thematic inflection of *humus* is original,[15] *o*-vocalism would not be problematic morphologically, and could even, in principle, be accounted for phonologically on the basis of an *e*-grade, at least according to the traditional version of the *o*-umlaut rule referred to above (thus thematic **hem-o-* > **hom-o-*).[16] But there is no good reason to suppose that the noun *humus* (as opposed to derived adjectives like χθόνιος) is to be explained (at least directly) on the basis of a thematic formation; far more likely is the widely-accepted idea that thematic *humus* is back-formed from the original (athematic) locative *humī*, cf. *domī* etc.[17] It should be noted that the resulting (pre-*umerus*-rule) loc. **hom-ei* could no longer be explained, in this case, via the *o*-umlaut rule (even in its traditional form), since the presumed (under this theory) ***hem-ei* would no longer fit the structural description of the rule. One must thus consider the possible

---

[14] On the IE preform see recently J. Hilmarsson, *Sprache* 33 (1987) 69.

[15] Thus apparently Buck *Comp. Gr.* 82, 84; less clearly Szemerényi *Quellen* 48 n. 67 ("*homō* und o.-u. *homōn-* haben ihr *o* von dem Grundwort **ghom-*, lat. *humus*"), who seems in any case to assume inherited *o*-vocalism for *humus*.

[16] For notational convenience I operate here with a proximate pre-Lat. **hem-*, **hom-* etc. for **(dh)ĝhem-* etc.

[17] Thus e.g. Ernout *Morph. hist.* 24, Monteil *Éléments* 149 n. 1, see also M. Peters, *Sprache* 30 (1984) ad *Idg. Chron.* 30a.785 on *humus* and Osc. ΗΟΜΙΟΙ (*RV* 52, more on which below, **9.3.d**).

morphological sources for *o*-vocalism in the athematic locative that appears in Latin as ***hom-ei*.**

9.3.b In principle, an original non-*o*-vocalism, whatever it might have been, could have been influenced by the *o*-vocalism of a parallel thematic derivative like χθόνιος, which would constitute a more legitimate appeal to such a form than assuming an actual thematic basis for ***humus*** or ***humī***. Such a process, to be sure, is securely attested (as in Lat. *pondus* for ***pendus*)**; but in general, the thematic formations responsible for these adjustments are close to hand (thus *pondō*, cf. in general **3.5.c** above), whereas no such thematic ***hom*-** form is to be found in Latin (or, for that matter, elsewhere in Italic).[18] This sort of approach, then, while it cannot be ruled out completely, amounts to a last resort, to which one could appeal if the expected morphological sources of such a locative yield no acceptable results.

Now as Nussbaum has shown (***Head and Horn*** 188), the locative of such a root-noun can have had two types of formation, namely the original endingless type as seen in Ved. ***kṣámi* < *dhĝh-ém(+i)***, or the ***en*-locative** type as in Ved. ***jmán* < *dhĝh-m-én***. In principle, we may expect the athematic locative underlying ***humī*** to continue either of these formations. The first would presumably have yielded an "*e*-grade" ***hemī***, which should have remained intact (cf. ***hemonem***), and is therefore incapable of accounting for ***humī*** (***homei***) directly.[19] But the second (fitted out, of course, with loc. desinence ***-ei***) would provide a zero grade likely to be vocalized as ***dhĝhm̥(m)-ei***, which would have the interesting consequence (if this morphological analysis is accepted) of demonstrating the regular phonological outcome of prevocalic ***m̥(m)*** to be Lat. ***om***, and not ***em*** or ***am***, as is usually thought.[20] According to this analysis, then, the *o*-vocalism

---

[18] For other *o*-grade forms, see **9.3.d** (Umbr. ***hondomu***, ***hondu*** etc.) and **9.3.e** (SPi. ***homanah***) below.

[19] On ***hemonem*** (as also Li. ***žẽmė***, OCS ***zemlja***, Neo-Phryg. ζεμελ-) as derivatives of this locative stem, see E. Hamp, *HS* 103 (1990) 290.

[20] I owe to Jay Jasanoff the idea that ***m̥(m)*** might regularly develop to Lat. ***om***, although he does not necessarily endorse this view.

of *humus*, although sometimes explicitly taken to be old,[21] is only relatively old, reflecting an original zero grade.[22]

9.3.c The prevocalic treatments of the syllabic resonants are of course notoriously controversial, but it can at least be said that the evidence in favor of **m̥(m) > em* and **m̥(m) > am* is not compelling. For the latter,[23] comparison with **r̥(r)*, **l̥(l)* and (to a lesser extent) **n̥(n)* (for which there is at least some circumstantial evidence for *ar/al/an*) is not probative:[24] there is nothing, in any case, to prevent the phonetically plausible development *om* for the labial nasal. Similarly, appeal to the Celtic treatment of the superlative morpheme proves nothing, since Lat. **(-is)-omo-* (or Osco-Umbr. **-tomo-* < **-tm̥(m)o-*; Osc. **últiumam**, Umbr. *hondomu*) can as easily (if not more easily) derive from **-omo-* as **-amo-*.[25]

For **m̥(m) > *em*, the sole example seems to be Lat. *semel*, taken to reflect a zero grade on the basis of Gk. ἅμα (e.g. Leumann *LLuF* 59).[26] But the formations differ, and so there is no guarantee that *semel* must be based on a zero grade, especially in view of the probable full grade **sem-* in at least some of Lat. *semper, simul, similis, singulī*, etc.;[27] and even in

---

[21] Recently e.g. Vennemann, in *New Sound* 110 (vs. zero grade for Gk. χαμαί, 111).

[22] This seems also to be the view of Hamp (op. cit. 289), who begins from a zero grade **dhĝHm-* together with the "Sievers situation with the condition for a syllabified nasal" to account for Lat. *humus* and Gmc. 'man' (Go. *guma* etc.), comparing also Gk. χαμαί; cf. also Leumann (*LLuF* 59), who notes, after his discussion of *semel*, "aber auch *um* in *humī* gleich gr. χαμαί und *hum-us*".

[23] E.g. Buck *Comp. Gr.* 104 (on the chart: "*am* (?)", but no examples provided), cf. Szemerényi (loc. cit.): "idg. **ghm̥ōn* ... nur zu **hamō* hätte führen können".

[24] Lat. *carō, manēre* etc. (Leumann *LLuF* 58f.), cf. Leumann 59: "man erwartet *a* wie vor *r l*, also *am, an*"; but *en* has also been preferred for **n̥(n)* (e.g. Cowgill "Superlatives" 148 n. 24, with some hesitation), largely on the strength of Lat. *tenuis*. See, however, R. S. P. Beekes, *KZ* 96 (1982/1983) 206, 228 for analysis in terms of a set zero grade **tn̥h₂-u-* (cf. Ved. *uttānā-* < **-tn̥h₂-nó-*, 206 n. 2), followed by Schrijver *Laryngeals* 219; similarly F. Bader, in *Laryngales* 18.

[25] The superlative form(s) might also be specious, if the laryngealistic reconstructions are correct (see e.g. Meiser *Lautgesch.* 271 for the possible vowel-weakening [as opposed to syncope] in *hondomu* [for expected **hondamu*] < **ĝhom-tm̥ho-*); on the root vocalism of *hondomu* also **9.3.d** below.

[26] Sommer-Pfister *Hdbch.* 45 adds "early Lat. *hemō*" as another example, on which further **9.3.d** below.

[27] Indeed, for ἅμα itself, the unexpected accent is perhaps best explained (following A. Sihler, *JIES* 1 [1973] = *FS Poultney* 112f.) on the basis of a full grade **ἑμα* (comparable to *semel*), to which a vowel assimilation has applied.

the event that *semel* (or *similis*) is based on a zero grade, a set **sm̥h₂-*, for which *sem-* would be regular, cannot be excluded in any case (see Schrijver *Laryngeals* 218, and n. 24 above on Lat. *tenuis*).[28]

9.3.d It remains to draw some final (partly speculative) inferences from the above discussion.

Note first that if **m̥(m)* > Latin (or perhaps Italic) **om*, it is conceivable that Enn./Liv. Andr. *homōn-* (: Osc. **humuns**, Umbr. *homonus*) as well as Class. *homō* (i.e. **homen-*) could derive from an inherited zero grade (cf. Go. *guma*, Li. *žmuõ* etc.), beside the *e*-grade of *hemonem*.[29]

As for other non-Latin *o*-grades: the meaning of Umbr. *hondu* (although often placed with *humus* etc.) is too uncertain to allow for reasonable choice among several plausible etymologies (see Meiser *Lautgesch.* 168 with n. 4). Rather more likely to belong with *humus* are the comparative and superlative forms Umbr. *hondra*/**hutra**, Osc. **huntru-** and Umbr. *hondomu* (perhaps also the Umbr. theonym *Honde*/**Hunte**). But here again, there seems no obstacle to supposing that these, too, ultimately derive from the weak stem of a root noun **(dh)ĝhŏm/*(dh)ĝhm̥(m)-´* etc. > **hōm/*hom-*, rather than a primordial *o*-grade. Osc. ΗΟΜΟΙ, as already noted, could be directly equated with Lat. *humī;* but unfortunately, the existence of this form (still maintained by Lejeune, *Méfitis* 21, 55) has properly been called into question by L. Del Tutto Palma, *SE* 55 (1987/1988) 367ff. and 57 (1991) 179ff.

9.3.e As for the "*umerus* rule", note that the above analysis assumes that this applied not to an earlier version of thematic *humus*, but already to the athematic loc. **homei*. Insofar as this form shows the same sequence **ome(i)* that appeared in the immediate pre-forms of *umerus, cumera/*

---

[28] Among other more or less plausible accounts of *semel*, pre-consonantal **sm̥-(m-)* > Lat. *sem-* would also be expected for Wackernagel's **sm̥-mēli* 'one time', cf. Go. *mel* 'time' etc. (*KZ* 30 [1890] 316, cf. Coleman in *IE Numerals* 415, 440 n. 86).

[29] This seems preferable to the view (cf. n. 26 above) that *hemonem* reflects the original zero grade, since *hemonem* (like *semel*) can also reflect an *e*-grade, while *humī* (according to the analysis suggested above) cannot.

cumerum 'bin, basket',[30] and perhaps *numerus* 'measure',[31] it may be preferable to resolve this process into two or more distinct forms, i.e. *ome(i)* > *ume(i)* (thus perhaps to be interpreted phonetically as a dissimilatory raising), vs. another pre-consonantal version applicable to *om/on* more generally (*umbō*, *umbilīcus*, *lumbus*, like *uncus*, *unguen* etc.), although the *umerus*- and *umbō*-phenomena are generally conflated in the handbooks.[32]

This early *o* > *u* process[33] is presumably what lies behind the odd root vocalism of *hūmānus:* the original root noun with nom. sg. **hōm* (cf. Gk. χθών), loc. sg. **homei* could have undergone the *o* > *u* rule in most sg. forms of the paradigm except the nom., resulting in nom. **hōm*, loc. **humei* etc. If an old adj. **hōm-āno-* already existed (cf. perhaps SPi. *homanah* AQ 1), this might naturally have been adjusted to **hūmāno-* after **humei* etc. (Alternatively, the nom. **hōm* could first have been reshaped to **hūm*, before the formation of **hūm-āno-*.) Finally, it would be attractive to assume (although impossible to prove) that the *vera lectio* behind P.F. *hemona* 'humana' (cf. **9.2.b** (iii) above) is actually *homana*, directly comparable to SPi. *homanah:* although several scenarios are possible, one could imagine, for example, that an original sequence *homana humana* might easily have ended up *humana humana* at some stage of the transmission, at which point the first form in such a dittographic sequence — if it is to be retained at all — would inevitably have had its vocalism

---

[30] Cf. perhaps Ved. *camasá-* '(wooden) goblet', *carisá-* '(metal) vessel' (Walde-Hofmann *LEW* s.v. *cumera*), see now Mayrhofer *EWAia* I.4 286 and I.7 530 s.vv.

[31] Perhaps (as generally thought) to Gk. νέμω 'distribute' etc.; also *nummus* if < **nomimos*.

[32] See now also Parker *Rel. Chronol.* Ch. 6 §23. Forms like *tumulus* (cf. *tumeō*) may have original *u*-vocalism, and thus do not contradict the *ome(i)* > *ume(i)* rule as just stated. In apparent counterexamples of the type *comes* 'companion' (stem **com-it-*), the sequence *-ome-* would have arisen too late to be affected by the rule. Moreover, in *comes* as in other formations with *com-* (e.g. *comedō* 'eat'), the otherwise normal *com-* would no doubt have been preserved analogically in any case. Similarly, the locative **domei* > *domī* (not ***dumī*, as might be expected by the rule), as the only part of the paradigm whose environment matched the rule's structural description, can result from paradigmatic pressure from nom. **domos*/**domus*, gen. **domous*, abl. **domōd*, etc. (in contrast to *humī*, which served as the basis for a new paradigm). One would thus predict that such a rule should be visible primarily in isolated extra-paradigmatic situations, or in forms not readily susceptible to analogical pressure (as with prefixed *com-*), i.e. precisely forms of the type *humī*, *umerus*, *cumerus*, etc.

[33] Exactly how early depends on the authenticity of **Numasioi** in the Praenestine fibula (CIL 3).

adjusted on the basis of the immediately following pair of terms ***hemonem hominem,*** whence the attested ***hemona humana.***

CHAPTER TEN

On Orthographic Variation in CIL 584 (Sent. Minuc.)

10.1 *Introductory*
10.2 *"Arbitrary" vs. "Conditioned" Orthographic Variation (I): n(e)i*
10.3 *"Arbitrary" vs. "Conditioned" Orthographic Variation (II): i(o)us-*
10.4 *Archaizing "Corrections" (I): infim-/infum-, pos(s)-*
10.5 *Archaizing "Corrections" (II): qu(e)i, d(e)ors-, su(r)s-*
10.6 *Archaizing "Corrections" (III): ib(e)i*

10.1 *Introductory*

10.1.a M. Frederiksen, in his important study of errors and drafts in Republican municipal laws ("Errors"), established that "the municipal laws of the Republican period were all engraved locally, and show various degrees of on-the-spot alteration" ("Errors" 197). With regard to this alteration, he noted further that "the scribal practices of the Italian towns differed widely", and that "the oddities of form and style in these documents are but the natural reflections of a large degree of local participation" (198). Note also Frederiksen's more detailed discussions of various error types that can be ascribed to local engravers, such as false resolutions of probable abbreviations (in a handwritten copy text), or incorporation of supralineate corrections appearing in the copy text, letter confusions arising from local use of cursive forms, etc. (see esp. "Errors" 186ff.). This conception has a number of consequences for the analysis of linguistic material in such documents,[1] including orthographic variation — in particular, variation judged to be "arbitrary" or "inexplicable", including archaisms "employés au hasard" (see §4 of the "Introduction").

[1] See already **6.2.b**, concerning **af** in CIL 586 (Epist. ad Tib.).

10.1.b A somewhat similar conception, with particular reference to the Sententia Minuciorum,[2] was arrived at independently by G. Petracco Sicardi. In a detailed study ("Sent. Minuc.") of the linguistic "anomalies" of the document, Petracco Sicardi placed special emphasis (235ff.) on a series of "dialettismi".[3] While admitting that these might be explained on the basis of a local engraving, he suggested an alternative hypothesis, according to which the document passed through a redaction colored by the technical intermediaries charged with the actual *terminatio*, and therefore reflects the sociolinguistic mixture bound to be a feature of the language of such speakers.

10.1.c Not all orthographic variation in such texts, however, can be accounted for on the basis of "local" traits (however they are to be explained) or faulty engraving. Thus the Sententia Minuciorum is cited by Frederiksen (187) as an example of just such a locally-produced document: nevertheless, the actual inventory of more or less clear "dialettismi" extracted by Petracco Sicardi turns out to be very restrained indeed; and moreover, as observed by Kent (*Criticism* 68), this is a document with "very few errors", nor is it characterized by frequent corrections.[4] As with many similar texts from this era, the style and orthography of this document are judged to be archaizing, but "inconsistent".[5] The following analyses of some orthographic inconsistencies in this text seek to show that the characterization of some types of variation as "arbitrary" or "inexplicable" is overstated; indeed, certain types of inconsistency may be linguistically revealing, as indicators of orthographic norms and archaizing trends.

---

[2] CIL 584 (117 B.C., found near Genoa), pp. 453, 910; De Rosalia *Iscrizioni* 47, Ernout *Recueil* 138, Degrassi *ILLRP* 517 (*Imagines* 394), Pisani *Testi* A31, Warmington *Remains* p. 262.

[3] Cf. **8.5.b** on 584.29 **eus** (nom. pl.).

[4] Petracco Sicardi ("Sent. Minuc." 233-5) finds a mere ten errors, of which several (as he admits) can be discarded if they are taken as nom. pl. -e(i)s forms, as is likely (cf. **8.9.b** and Ch. **8** passim).

[5] Thus e.g. Ernout *Recueil* p. 92: "Graphie et Phonétique: archaïsantes, avec des inconséquences", cf. Warmington *Remains* p. 262 n. 2: "The language of this inscription attempts inconsistently the style of an earlier period".

10.2 *"Arbitrary" vs. "Conditioned" Orthographic Variation (I): n(e)i*

10.2.a There are, to be sure, numerous orthographic inconsistencies, to which the highly repetitive nature of the text is no doubt a contributing factor. Certain variations, moreover, appear at first sight to be entirely arbitrary, as with sequences like

30 **ni**
32 **nei ... nive**
34 **ni ... nive ... neive**
36 **nei**
40 **ni ... nive**

The impression of arbitrariness created by such sequences results from the close succession of variants in what appear to be random "alternating" patterns, sometimes even within the same line. But the distribution of the various forms of the negative particles in archaic inscriptions is in fact fairly complex. In some respects, especially with regard to the development of orthographic usages over time and within individual texts, the data are susceptible of more orderly description than is generally assumed.

10.2.b Despite the impression given by Leumann (*LLuF* 64) and Wachter (*Altlat. Inschr.* §121b), the alternation between **neiquis** and **nequis** in the Senatus Consultum de Bacchanalibus (CIL 581) need not reflect an arbitrary or analogical (cf. **sei**) instance of graphic alternants **<ei>** and **<e>** for a closed long /ę̄/.[6] This text uses **ne(-)** as its "norm" (21x), while the **neiquis** of line 3 is unique. But **neiquis** is the only instance in which the negative appears in sentence-initial position, and indeed the sentence **neiquis.eorum.<B>acanal.habuise.velet** begins the entire text of the prohibition proper, following the introductory matter. Thus, as frequently noted by Ernout,[7] this text still distinguishes between the "emphatic" negative **nei** (with **nē* reinforced by a deictic particle

[6] More recently see also Eichner "Reklameiamben" 228 n. 56 on early (prohibitive) **ne** vs. generally later (and non-urban) **nei/ni** (with reference to some of the texts cited below).
[7] E.g. *Recueil* 126 ad loc. (p. 63), Ernout-Meillet *Dict.* s.v. *nī*, Ernout-Thomas *Syntaxe* 148.

-ī/-ĭ, cf. Osc. *nei*, OCS *ni* etc.) and the simple (prohibitive) negative **ne** (< *nē, cf. Osc. *ni*, OCS *ně-kŭto* etc.).

In later second-century texts, however, this distinction has been lost, and indeed **nei** (including **neive, neiquis**) has become the norm (cf. Eichner, n. 6 above). Thus in the extant fragments of CIL 583 (Lex Repetund.), **nei(-)** appears 21x, while **ne** appears only twice, in constructions identical to those also occurring with **nei** (35 **ne.faci[to]**, cf. 69 **nei.facito**; 16 **[d]um.ne.quem.eorum.legat.quei**, cf. 10 **[dum.]nei.quem.eorum.det.sciens.d.m.quoiei**). In CIL 582 (Lex Bant.), **ne** is not found at all, beside **nei** (2x) and **neive** (8x).[8] Similarly, the "Fragmentum Tarentinum" (CIL 2924) shows **nei** (1x), **neive** (4x) and **neiquis** (1x), beside **nive** (1x).[9]

10.2.c It is within this context of such developing orthographic norms that one must view the variation **nei/ni** found in CIL 584 (Sent. Minuc.), for which a preliminary listing was provided in **10.2.a**. Here **nei** (3x) is outnumbered by **ni** (7x), which thus appears to reflect the "norm" for this text; but this does not mean that the distribution itself must be conceived of as entirely arbitrary: in principle, such a system of fluctuating orthographic habits is capable of generating new distinctions, which may be comparable in kind to that preserved in CIL 581. In fact, **nei** and **ni** in this text can be said to appear in complementary distribution, as follows: **nei** is used as the "independent" negative form, while **ni(-)** is restricted to use preceding enclitics (i.e. it is a "bound form"), these statements accounting for all but one of the examples in question:

nei.babeto (32)
nei.debento (36)

vs. **ni.quis** (30)
niquis (34, 40)
nive (32, 34, 40 bis)

[8] A possible ninth instance of **neive** in this text is controversial, and is treated in the next section.

[9] This attestation of **nive** is discussed further in the next section.

in which the contrast between **nei** and **ni** in the consecutive phrasing **nei.habeto.nive.fruimino** (32) seems particularly telling.[10] In a similar way, the sole **ni-** in CIL 2924 (Frag. Tarent., line 21) appears in the "double enclitic" sequence **nive.quis** (beside **nei/neive/neiquis**), in a passage (**nive.quis.sinito** etc.) similar to the problematic instance in the Lex Bantia referred to above (CIL 582.20 **]-e quis sinito**). Of the letter preceding the **-e** in this last passage, only two strokes are visible (cf. Degrassi *Imagines* 383, Ritschl *Prisc. Lat.* 19); Mommsen's earlier **]ṇi quis** is rightly rejected at CIL p. 439, but the alternative **]ṇe quis**, in a text in which **nei** is used as a norm, as described above, is not satisfying. Mattingly, however, plausibly restores as **[nei]ṿe quis (sinito)**,[11] after the parallel phrase **nive.quis.sinito** from the Frag. Tarent., just cited. One might just as easily, however, restore **[ni]ṿe**, in which case the sole "neologistic" occurrence of **ni** in this text would again appear precisely with following (pronominal) enclitic, beside **nei.sinito** (5), **nei.petito** (19), and **neive** (8x).

10.2.d In view of well-known problems concerning the interpretation of orthographic **<ei>**, **<e>** and **<i>** in the mid-to-late second century, the phonetic reality behind such orthographic alternations is difficult to grasp. But even if the composers, engravers and/or readers of CIL 584 pronounced **nei** and **ni** identically, an artificial orthographic/functional distinction of the sort hypothesized above need not be excluded. It is particularly interesting in this connection to note Campanile's suggestion (*SSL* 3 [1963] 58) that Oscan *ne/nei/ni* are distributed in non-random fashion in the (more or less contemporaneous) Tabula Bantina (Ve 2; NB: written in the Latin alphabet), as follows:

> *ne* with pronominal stems: *ne.pon* (14), *ne.phim* (25)
> *nei* with *suae* (*nei.suae* 28 bis), cf. *suaepis.censtomen.nei.cebnust* (20)
> *ni* elsewhere: *ni.hipid* (8, 14, 17), *ni.fuid* (29)

---

[10] The only form not accounted for according to this schema is **neive.prohibeto** (34), in the extended series **niquis.prohibeto.nive.quis.vim.facito.neive.prohibeto.**
[11] Discussion and references at CIL pp. 907f.

10.3 *"Arbitrary" vs. "Conditioned" Orthographic Variation (II): i(o)us-*

10.3.a Still other forms of variation that at first sight appear random may be susceptible of some explanation, or at least can be seen to pattern in certain non-random ways. The following alternation in CIL 584 between

3 **iuserunt**
4 **iouserunt**

constitutes the first example of inconsistency cited by Ernout (*Recueil* ad loc.) under the heading "diphtongues" ("**iouserunt** l. 4, mais **iuserunt** l. 3"); but the variation here is anything but arbitrary. Note that with **ou** vs. **u** in such cases (as with **ei** vs. **i**), the more archaic (or archaizing) variant requires two letters, while the newer orthography requires only one.[12] Therefore, assuming that both variants are available as options, in certain situations the simple factor of space will be a consideration as to which variant is chosen — especially at line-end — just as this factor enters into other well-known choices, such as the use of fully spelled forms as opposed to forms spelled with ligatures (cf. **12.1.a**). Note further that this consideration is more pressing for V (single "broad" character) vs. OV (two "broad" characters) than it is for E (single "broad" character) vs. EI (one "broad" and one "narrow" character).

10.3.b In the present case, while **iouserunt** is found in approximately the middle of line 4, **iuserunt** is the last word of line 3; moreover, the spacing at the end of line 3 was unusually cramped even before the word **iuserunt** was reached, because of the large dangling R of **inter** in line 1, which actually occupies the very end of both lines 2 and 3, approximately as follows:

[12] For present purposes, it is immaterial whether **ius-** here spells /iūs-/ or /iuss-/; cf. **10.3.c** below.

1 ...I N T E
2 ... C O M P O S E I V E R V N T
3 ... I V S E R V N T R

Thus **iuserunt** has a good chance of being a "conditioned variant", while the archaizing **iouserunt** (cf. earlier e.g. CIL 583.69 [Lex Repetund.] **iuserit**) can be considered to reflect the orthographic norm of this text.

10.3.c B. B. Xodorkovskaja, in her recent listing of the inscriptional variants **ious-** and **ius(s)-** (*VJ* [1989.6] 8), cites **iuserunt** for this text, but fails to note **iouserunt**; the variation just described, however, supports the traditional view of the innovative nature of **ius-** vis-à-vis **ious-**, despite the arguments advanced by Xodorkovskaja in favor of taking the stem *iŭs(s)-* to reflect an archaic zero-grade form of sigmatic aorist.[13]

10.4 *Archaizing "Corrections" (I): infim-/infum-, pos(s)-*

10.4.a In several other sets of orthographic variants, where considerations of space are less in evidence (although sometimes perhaps a factor, as will be seen), the linear organization of the variants can be described as "non-random", according to the following pattern: a "modern" variant is followed at a relatively close distance by an archaizing variant. When only two members are involved, as in 29 **ita.uti.ceteri** | (NB: at line-end) vs. 33 **ita.utei.in.cetero.agro**, one is reluctant to make much of such a pattern; still more complex is the "contradictory" patterning of a pair like 25 **in.anos.singulos** (*-n-* but *-ul-*) vs. 28 **in.annos.singolos** (*-nn-* but *-ol-*, cf. earlier **in.annos.singolos** CIL 583.2 [Lex Repetund.], further **anno** 583.7, **annum** 583.19, 20). Several more extended examples, however, although not devoid of certain complexities, provide clearer

[13] In a rejoinder to Xodorkovskaja, Ju. V. Otkupščikov (*VJ* [1989.6] 20f.) argues convincingly for the traditional understanding of **ioub-/ious-/ius(s)-** (on which see e.g. Leumann *LLuF* 541).

evidence for such a pattern, with the added feature that the "modern" variant is the first one attested in the text — indeed, generally appearing within the first ten lines.

Consider first the distribution of **infimo/infumo, -um**:

6 **infimo**
vs. 10 **infumum**
14 **infumo**
20 **infumo**

Here 6 **infimo** is in fact the first attestation of the spelling with **<-i->** for the "sonus medius", while all subsequent attestations revert to the traditional spelling with **<-u->** (see e.g. Sommer-Pfister *Hdbch.* 88, Allen *Vox Lat.* 57).[14]

10.4.b The variation **poss-/pos-** for forms of *possidēre* follows much the same pattern:

3 **possiderent**
vs. 13 **posident**
24 **po[si]dere**
28 **posedet, posedeit**
29 **posidere, posidebunt**
30 **posidebunt, posideto**
38 **posident** (bis)
40 **posidebit**

The consistent (after the initial form) archaizing spelling **pos-** here, without geminate, is particularly striking for this word (and therefore of itself a significant index of the archaizing nature of this document), since the word seems to have regularized the geminate spelling relatively early: in addition to earlier spellings with geminate (e.g. CIL 583.57 [Lex Repetund.] **possideantur**, still earlier 614.5 **possidere** beside

[14] R. Coleman (in *I E Numerals* 397), discussing the chronology of *-imus* vs. *-umus*, cites "*infimo* beside *proxumo* (CIL 1.584)" from this text, the latter presumably for the **proxuma** actually attested (lines 37, 42), and ignores the actual contrast **infim-/infum-**.

posedisent), note also the slightly later CIL 585 (Lex Agr.): beside forms like **habuisent** (91), **fuise** (passim), we find regularly not only **possid-/ possed-** (14, 18, 32, 40 etc.), but also the extremely frequent **possesio/ possesor** (in various case forms), uniformly spelled **posses-** (with the single exception of 92 **possessione[m]**, beside **posses-** twice in the same line). Here the "single-geminate" spelling **posses-** (never ***poses-** or ***posess-**, and only once with fully "modernized" double-geminate **possess-**) can perhaps be taken as a further indication (if not also a consequence) of the fully-entrenched single geminate of **possid-/possed-**.

10.5 *Archaizing "Corrections" (II): qu(e)i, d(e)ors-, su(r)s-*

10.5.a Only slightly more complex than **possid-/posid-(posed-)** is the variation found for **qui/quei**:

6 **qui**
vs. 11 **quei**
12 **quei**
13 **quei**
17 **quei**
18 **quei**
28 **quei** (bis)
29 **quei**
30 **qui**
31 **quei**
32 **quei**
42 **quei**

Here again, the attestations begin in line 6 (in fact, in the phrase **ab.rivo.infimo**, cf. 6 **infimo** above) with the "modern" form (cf. 3 **possiderent**), but continue with the archaizing version in all instances but one. This sole later instance of **qui**, however, follows almost directly the **uti** cited above (which itself appeared as **utei** in its next occurrence), as well as the nom. pl. **ceteri** (cf. already nom. pl. **purgati** in CIL 586.12 [Epist. ad Tib.]), i.e.: 584.29-30 **ita.uti.ceteri | Langenses.qui.** The

pattern with **quei** is then immediately re-established in the next line. It is likely, then, that the **qui** of line 30 is to be judged an aberrant variant (with respect to the orthographic norms of this text), not only because of the overall frequency of **quei** vs. **qui**, but in view of its possible "conditioning" by the preceding **uti** and **ceteri**, together with the initial pattern "opening (modern) **qui** > 'corrected' (archaizing) **quei**", as with **infim-** > **infum-** and **possid-** > **posid-**.[15]

10.5.b Similar to **quei/qui**, note also:

9 **dorsum**
vs. 10 **deorsum**
12 **deorsum**
19 **deorsum**
20 **dorsum**
22 **deorsum**
23 **deorsum**

Again: the initial **dorsum** is immediately "corrected", as it were, to the fuller version **deorsum**, which is then maintained with almost complete consistency. Here it may be significant that the aberrant **dorsum** in 20 occurs near line-end (... **inde.dorsum.iugo.recto.in** |), while **deorsum** is line-initial in 22 (**inde | deorsum**), and in second position in 23 (| **inde.deorsum**).

10.5.c In a similar way, *sursum* begins with its *r*-less version

7 **suso, susum**
8 **susum**

[15] Another possible index of current **<-i->** vs. archaizing **<-ei->** in this text appears in the error **leiberique** (line 44) for **leiber<are>ique**, in the series **solvei.mittei. leiber<are>ique**: despite the three instances of **-ei(-)** directly preceding, the engraver continued with **-rique** (not **-reique**) after the haplological omission occasioned by the consecutive syllables *-er/-ar*.

(cf. 2 **controvosias**, after 1 **controvorsieis**), but then appears as **surs-** with almost complete consistency:

10 **sursum**
14 **sursuorsum**
15 **sursumuorsum**
susum
16 **sursum** (bis)
17 **sursum**
18 **sursum**
20 **sursum**
21 **sursum**

Here, however, one can discern a kind of rationale behind the orthographic switch. If one correlates these occurrences of **sus-/surs-** with those of its paired semantic opposite **d(e)orsum**, it becomes clear that the *r*-form **surs-** begins to appear precisely after the first two occurrences of **d(e)orsum**, which then continues to alternate with **sursum** (naturally enough, given the meanings of the two terms and the nature of the text), lending support, as it were, to the spelling **surs-**:

7		**suso**
		susum
8		**susum**
9	**dorsum**	
10	**deorsum**	**sursum**
12	**deorsum**	
14		**sursuorsum**
15		**sursumuorsum**
		susum[16]
16		**sursum** (bis)
17		**sursum**
18		**sursum**
19	**deorsum**	
20		**sursum**
	dorsum	
21		**sursum**
22	**deorsum**	
23	**deorsum**	

Such parallel patterning is not isolated, as shown by the behavior of *susum* and *sursum* in the text of Petronius. Trimalchio uses *susum* by itself at 77.4; but in its other two attestations, the word appears together with *deorsum* in the form *sursum* (*nec sursum nec deorsum* 58.5 [Hermeros], *quod sursum est deorsum faciunt* 63.9 [Trimalchio]), "perhaps to preserve the homoioteleuton" (Boyce *Freedmen* 44f., following Nelson *Petronius* 51.).

[16] According to the pattern here described, this *r*-less **susum** of line 15 is the sole "inconsistent" example, with no obvious explanation. It can be noted, in any case, that the lettering of the sequence **inde.susum** in this line is visibly cramped in comparison with the immediately preceding **stat** and the immediately following **iugo**, and that **susum** here follows closely the error **termins** for **termin<u>s**.

10.6 *Archaizing "Corrections" (III): ib(e)i*

10.6.a The variation found with **ibi/ibei** is essentially of the same type as for **qu(e)i (10.5.a)**, although somewhat more complex, partly as a result of its frequency (20x, always in the formula **ibi/ibei.terminus. stat**, except once **ibi.termina.duo.stant**). As with **qu(e)i** and the other examples discussed above, the attestations commence with the "modern" form **ibi**, and almost immediately shift to **ibei**, which is maintained with some consistency, at least for a time:

7 **ibi**
8 **ibi**
vs. 10 **ibei**
11 **ibei**
14 **ibei** (bis)
15 **ibei/ibi** (cf. **10.6.c**)

10.6.b Before discussing 15 **ibei/ibi** and the remainder of the attestations (**10.6.c.**), it should be noted that the **ibi** of line 8 occurs in the sole instance of the extended version of the formula **ibi.termina.duo. stant.** Although **ibi** here occurs approximately in the middle of the line, inspection of the photographs reveals that the lettering is quite visibly compressed, and executed with noticeably smaller letters, in comparison, for example, with the preceding and following lines: thus **ibi.termina. duo.stant** (18 letters, or 21 characters, including punctuation) falls directly under the section **(flovi)um.Lemurim.inde.fl(ovio)** (15 letters/18 characters) in line 7, and directly above the section **(Nev)iascam.inde.dorsu(m)** (15 letters/17 characters) in line 9; these facts, then, may help to explain what appears to be a "delay" in shifting to the "corrected" version, as opposed to the other examples discussed above.

10.6.c Line 15, as already noted, contains two attestations, of which the first is **ibei**, and the second is **ibi**, the latter occurring nearly at line-end: 15-16 **ibi.terminus | stat.** The spelling **ibi** is carried over to the

next attestation (16), but then reverts to **ibei** in line 17, perhaps influenced by the preceding **quei** (17 **quei.vocitatust.Alianus.ibei.terminus. stat**). But then, at the second occurrence of the word in line 17, we find again (17-18) **ibi.terminus | stat,** with precisely the same patterning as in 15-16. The next two attestations (lines 18 and 19, both approximately in the middle of the line) revert again to **ibei.** In the remainder of this part of the text, however, there are seven more occurrences, as follows:

20 **ibi.terminus.stat** (bis)
21 **ibi.terminus.stat** (bis)
22 **ibi.terminus.stat** (bis)
23 **ibi.terminus.stat**

Thus, when the entire formula must appear twice in the same line, the "compressed" spelling **ibi** is used, which is then naturally maintained for the closing occurrence in line 23.

CHAPTER ELEVEN

So-called "Accian" Geminatio Vocalium

11.1 *Introductory*
11.2 *Oscan Geminatio and Geminatio in Latin Names*
11.3 *Geminatio in Other Lexical Items (I): aa, ee, oo, ii*
11.4 *Geminatio in Other Lexical Items (II): uu*

11.1 *Introductory*

11.1.a The optional doubling of vowel letters to indicate long vowels is a well-known feature of Latin inscriptions, especially prominent from about the late second century B.C. to the end of the Republic. This practice of "geminatio vocalium" is duly noted in handbooks both grammatical[1] and epigraphical,[2] and has figured in a number of studies concerned with Republican Latin orthography and paleography.[3] A very few works have been wholly devoted to this feature: among earlier treatments may be mentioned the influential paper of L. Pepe;[4] more recently, the standard treatment (in certain respects to be discussed below) has become that of R. Lazzeroni ("Geminatio").[5]

Discussions of geminatio have been remarkably limited in focus. With respect to the appearance of geminatio in inscriptions, attention has primarily been directed to two points, namely (a) relative chronology (so

---

[1] E.g. Leumann *LLuF* 12, Sommer-Pfister *Hdbch.* 32, Niedermann *Phonétique* 7, 55f., Allen *Vox Lat.* 64.

[2] E.g. Meyer *Einführung* 34, Gordon *Introduction* 14, Fedorova *Lat. èpigr.* 47, Almar *IL* 14f., 387 (erroneously recognizing only aa and ee), Wachter *Altlat. Inschr.* §204f with n. 1011.

[3] On the notation of vowel length in inscriptions, esp. J. C. Rolfe *PAPhS* 61 (1922) 83, R. P. Oliver *AJP* 87 (1966) 138, 151ff.; note also Petracco Sicardi "Sent. Minuc." 233, 238, Bernardi Perini "Riforme" 152ff., A. Prosdocimi *AION* 5 (1983) 255f. and *Tavole* 155ff. (responding to Bernardi Perini), H. Mattingly *Philologus* 131 (1987) 73f.

[4] "Accio, Lucilio e la 'geminatio'", *SIFC* 20 n.s. (1943) 105ff. (cf. Leumann's critique, *Glotta* 36 [1957] 128f.).

[5] "La 'geminatio vocalium' nelle iscrizioni latine", *ASNP* 25 (1956) 124ff.; more recently also Lazzeroni "Contatti" 292, 295f. and *AION* 5 (1983) 177ff.

as to evaluate the use of geminatio as a dating criterion), and (b) the geographical distribution of texts showing geminatio (both of which will be discussed in more detail below). Otherwise, on the basis of pioneering work of Ritschl, the bulk of the discussion has focused on the role of the poet and grammarian Accius in promoting geminatio (over the objections of Lucilius and no doubt others) as part of his program of spelling reforms, which in the case of geminatio proved completely unsuccessful.

11.1.b But despite attempts like that of Pepe to align the practice of geminatio as found in Latin inscriptions with Accius' orthographical theories, the correlation is clouded by the simple fact that geminatio is attested in other (non-Latin) Italic inscriptional traditions, and with notable frequency in Oscan. Thus, despite Ritschl and others, it is clear that geminatio cannot have originated with Accius,[6] and even the Latin grammatical tradition testifies that the system was already in use before the time of Accius' reforms.[7] The connection with Oscan was placed on a more solid footing by Lazzeroni's important study of 1956 ("Geminatio"), in which he demonstrated a statistically persuasive topographical correlation between Latin inscriptions with geminatio and the Oscan-speaking territory in which they were composed; hence his conclusion that "La *geminatio vocalium* è un procedimento grafico strettamente dialettale" ("Geminatio" 135). The significance of Lazzeroni's demonstration has been acknowledged by Bernardi Perini, who nevertheless continues to address geminatio in terms of various problems related to the Accian reforms, which will for the most part not concern us here. Prosdocimi, however, in the context of his discussion of geminatio in Umbrian (which raises still other complex problems that again cannot be pursued here),[8] poses the important question of precisely how Lazzeroni's theory is to be interpreted. As he notes, there are in effect two variants, according to which one views the adoption of geminatio in Latin as reflecting primarily

---

[6] Cf. already von Planta *Gramm.* 1.56 and Rolfe (loc. cit.), with the explicit suggestion that Accius borrowed the system from Oscan; similarly Leumann contra Pepe (cf. n. 4 above), and most recently J. Kramer, *ZPE* 88 (1991) 141 (geminatio "wohl nach oskischem Vorbild", without mention of Accius).

[7] Esp. Quintil. 1.7.14, see Oliver 152, Bernardi Perini 157ff.

[8] In addition to Prosdocimi's treatment (*Tavole* 155ff.), see also Meiser *Lautgesch.* 30f., 135ff. (esp. 144f.), and M. Lejeune, *BSL* 70 (1975) 242 with n. 37.

a graphic process, or rather one that is related to phonetic constraints similar to those that gave rise to the same practice in Oscan. What is needed, then, and what is so far conspicuously lacking, is a systematic examination of the linguistic (as opposed to the chronological or geographical) nature of Latin geminatio in terms of its Oscan counterpart, without which no further progress is possible in our understanding of the relationship between the two systems. Such an analysis of the actual behavior of geminatio in Republican Latin inscriptions may thus provide not only a clearer picture of the origin of the Latin system, but may also allow us to trace certain lines of development the system underwent within its relatively brief existence in Latin.[9]

11.1.c As noted above, conventional wisdom concerning the details of geminatio in Latin inscriptions is almost entirely concerned with the question of chronology, with a view to the use of this feature as a rough dating criterion, given the relatively brief and more or less well-circumscribed span of its appearance. Mattingly (loc. cit., see n. 3) has recently added several interesting points to this otherwise well-worn discussion. He observes, first, that the earliest datable instance of geminatio may be not CIL 638 **paastores** (Tab. Popill., 132 B.C.), as generally asserted, but rather CIL 2238 **aaram** (Delos, 135/4 B.C.).[10] He notes further that in any case, these two earliest datable examples are of **aa**, whereas **uu** is not known before 117 B.C. (CIL 584 [Sent. Minuc.] **Muucio, arbitratuu**). CIL 582 (Lex Bant.) shows both of these (**haace, luuci**) and also **ee** (**seese, leegei**), but is probably to be dated between 103-100, despite the earlier dating to the time of C. Gracchus sometimes claimed for this text.[11] The import of these chronological observations (**aa**

[9] The results of such an investigation have a certain theoretical interest as well, in terms of universal constraints on borrowed orthographic systems; on this point (in the context of "Minoan") see L. Stephens and J. Justeson, *TAPA* 108 (1978) 275, 279, where the universal statement to the effect that "retention of excesses from a model will be sporadic" seems particularly applicable to the present case, and further 282 n. 24, with notice of Oscan geminatio in connection with another of their proposed universals.

[10] See Mattingly (73 n. 18) for the Delian chronology; similarly Wachter (*Altlat. Inschr.* n. 1011: "zwischen 142v. und 134v.").

[11] See Mattingly's references (73 n. 20), as well as his discussion (74) of consonant gemination in CIL 582, which tends to support the later dating. For the later dating, see now also Eichner "Reklameiamben" 229 n. 56 ("100 v.Chr."), with reference to H. Galsterer, *Chiron* I (1971) 207 with n. 80.

> (aa/)uu > aa/uu/ee, at least in datable texts) will become apparent in the course of **11.2.**

Preliminary consideration of the little that has been said about the linguistic behavior of geminatio will be reserved for **11.1.f** below, after some remarks in **11.1.d-e** on recently-published data relevant to the problem.

11.1.d In view of the relatively limited attestation of this optional feature, an analysis of the sort proposed here must operate with as complete a collection of data as possible. But all of the existing published collections[12] are incomplete, partly as a result of new texts published in CIL I^2 (fasc. 4), including some not previously available in Degrassi *ILLRP* or other collections. It may be worthwhile, then, to append the following list of newer attestations not appearing in CIL I^2 (fasc. 1-3), including two new examples from texts published after CIL I^2 (fasc. 4), and a new example arising from a different reading of a well-known text.

Apart from an obvious error (CIL 2991a **Phieemo = Phi<l>emo**)[13] and two doubtful or improbable cases (3403 **Uutulta/ Vutulta**, 3591 **Coaitoo**), I note the following possible instances of geminatio in CIL I^2 (fasc. 4):

(i) **luudos** 2944 (Capua)
(ii) **Gaavia** 3011a (origin unknown)
(iii) **Gaa** 3013a (Rome)
(iv) **Fuurius** 3016a (Rome)
(v) **Puupius, Puupiae** (3x) 3018b (Rome)
(vi) **cuuriam** 3113 (Formiae)
(vii) **paagorum** 3269 (Pinna)
(viii) **aaram** 3295 (Interamnia Praetuttiorum)

---

[12] Note esp. CIL p. 813, Degrassi *ILLRP* 2.502, Leumann *LLuF* 13, Lazzeroni "Geminatio".

[13] Note the almost identical error in (Veneto-Latin) **Crumeeonia** (CIL 2812 = *MLV* 111, *LV* Es XXIII), cf. **Crumelonia** (2811 = *MLV* 114, *LV* Es XXVI), although the photographs of "**Crumeeonia**" (see *LV* ad loc.), which show traces of an L superimposed over the O, suggest a rather more complex series of errors and corrections. Several other erroneous or suspicious cases are noted by Lazzeroni "Geminatio" 127 n. 3, or appear in more recently published material (for the latter e.g. **Parteenin** for **Parthenica**, *AE* [1984] 441); cf. also n. 31 below on CIL 662b **Aarcello**.

(ix) **eemit** 3389 (Fanum Fortunae)

In addition, the badly-worn inscription 2948 (Capua) may have an instance of

(x) **Maamius** (thus Ferrua),

although this has also been read as **Mammius** (de Franciscis; see CIL p. 933 for details).

The recently-published "Tabula Alcantarensis" from Spain (104 B.C.)[14] provides the interesting example

(xi) **Roomanus**

which can now be added to the hitherto unique example of **oo**, namely CIL 365 **vootum** (on which see further ad (xiii) directly below). Also published subsequent to CIL I^2 (fasc. 4) is

(xii) **feecit** (Pianello di Ostra, late 1st c.; *AE* [1985] 372)

Finally, the form **veitam** previously read in CIL 364 (containing also **aastutieis**) is probably better read as

(xiii) **viitam**

as Wachter has shown (*Altlat. Inschr.* §204b), which after all (as Wachter notes) would be the etymologically more correct spelling.[15] It can be noted in passing that the continued wrangling over the alleged non-existence of <**ii**> and the extreme rarity of <**oo**> in relation to the Accian reforms (recently e.g. Bernardi Perini and Prosdocimi, locc. cit.) must be reconsidered in light of the last two forms. It is probable that Oliver

[14] R. Lopez Melero et al., *Gerión* 2 (1984) 265ff. (*AE* [1984] 495), see now also B. D. Hoyos, *ZPE* 83 (1990) 89ff.

[15] See **7.7.f** on the probable mid- to late-second-century dating of this inscription. This would therefore be one of the earlier inscriptions with geminatio, attesting both **aa** and **ii** (cf. **11.1.c** above).

(153f.) was correct in repudiating the dogma (associated with Ritschl) according to which Accius advocated geminatio only with A, E and V, but not O and I. The rejection of CIL 365 **vootum** on the basis that this text is "Faliscan" (thus e.g. Bernardi Perini 154) is simply illegitimate, in view of its heavily Latinized character (cf. **3.3.d** n. 69 above),[16] and in any case no such strategy will explain away **Roomanus**. For the rarity of **ii**, moreover, the potential for confusion with cursive E was no doubt a powerful factor, as Wachter notes (*Altlat. Inschr.* §100a).[17]

11.1.e The predominantly non-urban (esp. Osco-Umbrian) topographical distribution of these attestations (or their associations, in the urban texts, with *liberti*) corresponds perfectly with the pattern described by Lazzeroni for the previously-known examples. Moreover, just as Lazzeroni was able to point to relatively frequent co-occurrences of geminatio with other more or less clearly dialectal features, there are some similarly suggestive juxtapositions in some of the above material. Thus, two lines below **cuuriam** in CIL 3113 (Formiae) appears the form **muincip(ibus)**: despite Degrassi (in CIL), the original editor (Colombini) may well be correct in seeing here (at least in part) an Oscan-influenced spelling (cf. Osc. **múíníkú, múíníkei** etc., including abbreviations **múinik** Ve 84.4, **múí** Ve 50), as opposed to a simple engraving error. CIL 3013a **Gaa**, in a list of *liberti* and their descendants, is the only uncertain example among those cited in **11.1.d**, since this may represent the otherwise well-documented cognomen **Ga/Gaa/Gaha** elucidated by H. Solin (*BN* 8 n.s. [1973] 149ff.), and this appears to be the interpretation chosen in CIL (p. 976), following Solin (*Arctos* 17 [1983] 105). But this inscription also contains the Oscan-derived name **Mares**;[18] and moreover, the names ending the preceding two lines, and the name immediately preceding **Gaa**, are all abbreviated:

---

[16] Similarly the deceptively-phrased notice in Sommer-Pfister ("aus dem Oskischen und in Falerii bekannte"), as well as Lazzeroni's apparent discomfort ("Geminatio" 130 with n. 4) in the face of **vootum** and **aastutieis**; geminatio in echt-Faliscan documents is unknown.

[17] On Lat. **ei** and Osc. **íí** see also H. Rix, *AION* 5 (1983) 248.

[18] Cf. Osc. *Maras* (Solin, *Arctos* 17 [1983] 104f.), and more specifically, for the unusual grecized form **Mares**, see the discussion by P. Poccetti, *BN* 20 n.s. (1985) 242f.

2 ... **Diocl(es)**
3 ... **Alexand(er)**
4 **Apollon(ius) Gaa**

such that **Gaa** might well be an abbreviation, cf. 3011a **Gaavia**, Osc. **Gaav-** (Ve 115, 168), and the identical Osc. abbreviation format seen in **Paa** (Pocc 76, i.e. **Paa(pius)**), **Staa** (Pocc 67, i.e. **Staa(tius)**).

11.1.f Beyond the much-discussed problem concerning the "inventory", so to speak, of vowels liable to be spelled with geminatio (cf. **11.1.d** above, ad (xiii)), the only statements known to me about the actual behavior of Latin geminatio are the following:

(i) "[Geminatio vocalium] war meist auf die akzenttragende Silbe beschränkt, vermutlich weil dort die Länge des Vokals am deutlichsten hörbar war" (Wachter *Altlat. Inschr.* §98c).

(ii) "ricostruisco la proposta che la notazione di vocali geminate significasse, contro l'apparenza, non un vigore della quantità, ma un segno del suo dissolversi, donde una notazione ipercaratterizzata nell'ortografia, non riflesso di uno status ovvio, ma *strumento* ortografico per imporre o conservare uno status non più ovvio" (Prosdocimi *AION* 5 [1983] 255).

It is to be noted that both proposals are couched in phonetic/phonological terms,[19] but with entirely different assumptions about the status of vowel length (and, in the case of (i), the correlation with stressed syllables). As for (i), the inadequacy of Wachter's synchronic generalization is immediately apparent from a host of exceptions, beginning with the early example CIL 638 **paastores** (cf. **11.1.c** above), and including the recently-discovered form **Roomanus** (**11.1.d** above, (xi)). Although his statement about the predominant appearance of geminatio on stressed syllables may be statistically accurate, it is, as we shall see, fundamentally misleading, and fails to capture certain salient generalizations to be made about the behavior of Latin geminatio. In the case of (ii), it is more

[19] Cf. the second (i.e. "phonetic") variant of the Oscan-Latin hypothesis, as articulated by Prosdocimi (**11.1.b** above).

difficult to conceive of what sort of data might support such a hypothesis, which remains untested against the actual attestations of geminatio. In terms of distribution, however, such a theory would appear to predict either a more or less random appearance of geminatio spellings in various positions in the word (which is not the case, as we shall see), or else (under the assumption that the feature in question is more prominent in stressed syllables) a tendency for geminatio to appear mainly in stressed syllables (which is also not really the case, as just noted, despite appearances). In view of the underlying assumptions already elucidated about the relationship of Latin geminatio with Oscan, it is evident that a more accurate conception of the principles according to which Latin geminatio operates must be based on consideration of the behavior of geminatio in Oscan.

11.2 *Oscan Geminatio and Geminatio in Latin Names*

11.2.a Oscan geminatio has been studied in some detail by Lejeune (*BSL* 70 [1975] 240ff., 250f.),[20] beyond the simple fact of its apparently optional usage (as in Latin). Lejeune's survey of the salient features of Oscan forms with geminatio (243f.) can be summarized as follows:

(i) the great majority of instances of geminatio appear in the initial syllable of polysyllabic words; there are no examples of geminatio in a final syllable, and only one example in a medial syllable;[21]

(ii) geminatio is also attested in autonomous monosyllables, and in monosyllabic preverbs;

(iii) geminatio is attested in both open and closed syllables;

---

[20] "Réflexions sur la phonologie du vocalisme osque", hereafter cited as "Vocalisme"; earlier note also W. Schmid, *KZ* 72 (1954) 30ff. on anaptyxis, geminatio and accent (esp. 39ff. for geminatio), cf. next footnote.

[21] See Lejeune "Vocalisme" 243 n. 40 on the partly questionable status of **trístaamentúd** (Ve 11), whose **-aa-** occurs at line-end directly beneath **paam** of the preceding line (somewhat differently Schmid op. cit. 42, in terms of a late accent shift). As Meiser notes (*Lautgesch.* 145 n. 1), -faαμα- (Pocc 167, 168; probably also to be restored in *RV* 52, cf. L. Del Tutto Palma, *SE* 55 [1987/1988] 371) can easily be based on the simplex, cf. **faamat** (Ve 23, 24, 25); somewhat differently Lejeune, "Vocalisme" 243f.

(iv) in terms of vowel quality, about 55% of the examples are for **-aa-**, versus 45% for all other vowels.[22]

11.2.b By and large, the Latin data conform to this behavior: thus, most examples appear in initial syllables, with very rare exceptions (e.g. **T[e]muudino** CIL 808, **decoraat** 1570); monosyllabic examples are found (e.g. **ree** 1221, **iuus** 587), including prepositions (**ee** 1221; for preverb-like behavior note **aacetereis** 587); although most examples appear in open syllables, note e.g. **paastores** 638, **aastutieis** 364[23]; and the distribution of **aa** as against non-**aa** is approximately 50/50.[24] But there are still more precise convergences, which may help illuminate the diffusion and development of the system. In view of the special prominence of **aa** — both statistically (and perhaps therefore also perceptually, cf. Lejeune 244) and chronologically (cf. **11.1.c** above) — such forms may have played a more central role in the diffusion of the system to Latin; it seems not coincidental, then, that there are a number of actual lexical convergences between Oscan and Latin forms with **aa**, of which the most striking appear in personal names. As already seen in Chapter 8 above (and as will emerge in another connection below in Chapter **12**), onomastic material constitutes, after all, a natural carrier of spreading orthographic features:

Lat.	Osc.
Paapus 1605	**Paap-** Ve 160a, 200G (3x),
Paapia 1817	201, Pocc 34, 67
Paapilia 2282	**(Paap)**, 76 **(Paa)**
Paapi (Lazzeroni "Geminatio" 128)	
Paapius 2304	

[22] New Oscan materials provided by Poccetti require no adjustments to Lejeune's formulations, and mainly provide additional attestations of forms already attested with geminatio. See however **11.2.c** below on Pocc 34 **Paapii**.

[23] There is no basis for Ernout's emendation a[rg]utieis (*Recueil* 62 ad loc.), see CIL p. 404 ad loc., with photograph.

[24] Indeed, a somewhat reduced percentage for **aa** is probably to be expected, under the assumption that this pattern has diffused from the Oscan system, which lacks graphic **oo**, and which made relatively restrained use of **uu**, unlike Latin (cf. **11.2.e** and **11.4** below).

Staatia 1824 **Staatius** 1845	**Staat-** Ve 154, 160a, Pocc 67 **(Staa)**
Paacili 1438 (2x)	**Paak-** Ve 72e, 116
Gaavia 3011a **Gaa** 3013a (?)	**Gaav-** Ve 115, 168
Maamius 1549, 2948 (?)	**Maam-** Ve 32

Several such pairings, to be sure, were noted in passing by Lazzeroni ("Geminatio"),[25] but the full import of such correspondences — now bolstered by several new items — has to my mind been inadequately appreciated.

11.2.c Worth noting more specifically in this connection is the new attestation of Osc. **Paapii** recorded in Poccetti 34 (cited above), since the inscription may present two syntactic Latinisms involving onomastic constructions, both previously undocumented in the native alphabet: first, the use of ablative absolute in the opening sequence (**Mḷ[.]T[.]Nḭ[.]Dekitiúd[.]Mḭṃ.[.]pṷḍ**), and second — here involving the form with geminatio — the Latin use of **f**[.] after patronymic in the sequence **Ġ.Paapii[.]G[.]f**[.].[26] Poccetti (ad loc.) has rightly underscored the sociolinguistic interest of these data (which have an obvious bearing on the diffusion of geminatio in onomastic formulas), with further reference to Campanile's study of the "Latinization" of Oscan ("Latinizzazione").[27]

---

[25] Cf. also his observations ("Contatti" 296) concerning the frequent appearance of geminatio in Greek transcriptions of Latin names.

[26] Prosdocimi ("Studi 1980" 187) objects to Poccetti's characterization of the ablative as a "Latinism", but argues strongly (188 with n. 5 bis) in favor of the interpretation of **f** as a "latinismo" *f(ilius)*, contra J. Untermann, *Glotta* 57 (1979) 308 n. 63.

[27] Cf. also Lejeune *Anthrop. osque* 123ff. and in *Onomastique lat.* 35ff. on the "Romanization" of Oscan names; further Mello *Paestum* 75 on the distribution of Lat. *Papia* as cognomen (largely Campanian: Pompeii, Puteoli, Capua), and similarly *Paestum* 90 on *Statii* ("ampiamente presenti a Capua, ...; il *nomen Statius* è ben documentato anche a Pompeii").

11.2.d In addition to the direct onomastic comparisons cited above, one can also point to phonetically similar items like

Lat. **Vaar-**[28]**/Vaal-**[29]	cf. Osc. **Vaav-** (Ve 36)[30]
Lat. **Maarc-**[31]	cf. Osc. **Maak-** (Ve 200A.5)

as well as to possible extensions within Latin like (**Vaar-/Vaal-** >) **Laaro** 2110, (**Maam-** >) **Maanium** 2117.

Note finally that among names spelled with **aa** in Latin inscriptions, there is only a single instance of non-initial **-aa-**, namely **Calaasi** 1618 (Puteoli). In view of the predominant patterns with initial stress for both two- and three-syllable names (**Vaarus, Paapus, Paapia, Staatius** etc.), a form like **Calaasi** is probably best conceived of as reflecting an overgeneralized connection between geminatio and stress, which must nevertheless be secondary (cf. **Paapilia, Paacili**, and further **Luuceius** in the next section).

11.2.e Much the same sort of patterning appears in Latin names spelled with **uu**, although here direct comparanda from Oscan are lacking. Nevertheless, the two best-attested names *"Muucius"*[32] and *"Puupius"*[33] are easy phonetic extensions of Osc. **Maak-** and **Paap-** (cf. above).

Again, **uu** in Latin names appears almost exclusively in initial syllables, and nearly all forms have initial stress: in additon to *"Muucius"* and *"Puupius"*, also **Luucius** 2107, 2271, **Ruubius** 1373, **Ruufi** 1534, **Uuliu** 1679/**Uulius** 1635, **Fuuli** 2108, **Fuuco** 2401, **Fuurius** 3016a,

---

[28] CIL 780, 1299, 1465, 1529, 2162, 2283 (2x).

[29] CIL 2280, cf. Lazzeroni "Geminatio" 128.

[30] Cf. also Osc. **Veela** (Pocc 111; *SE* 53 [1985] 269f.) and **Aallasis** (*SE* 53 [1985] 277).

[31] CIL 747, 1202, and the frequent spelling Μααρκ- in Greek transcriptions of Latin *Marc-* (cf. Lazzeroni "Contatti" 292), e.g. Μααρκ- 4x (i.e. all occurrences) in CIL 2235 (Delos, cf. **5.2.a-b** on Delian Latin); perhaps also **<M>aarcello** for 662b **Aarcello**, although this might more easily be taken as **<M>arcello** (CIL ad loc.); it is not, in any case, likely to reflect an actual **Aarcello**, despite Lazzeroni "Geminatio" 132, who appears to take it as such, citing it as one of two instances of geminatio from Samothrace, the other being the genuine instance 578 **Luuceius** (bis), cf. next section.

[32] **Muucio** 583 (3x), 584 (3x), 585 (3x), **Muuci** 1450.

[33] **Puupius** 2271, 3018b, **Puupiae** 3018b (3x).

Iuulius 2191, **Suura** app. 369, in which certain relationships of phonetic similarity are again evident.

There are but two exceptions to the correlation between geminatio and initial stress just noted: of these, **Luuceius** 578 retains the Oscan-style marking of initial syllable, while **T[e]muudino** 808 — the sole instance of non-initial **-uu-** in a name — appears to show an overgeneralization involving geminatio and stress comparable to **Calaasi**, as suggested above. The form **T[e]muudino**, moreover, appears not only in the same inscription as **muunien[da]** (with **uu** in initial syllable, as expected, cf. **11.4.a** below), but positioned directly above it at a relatively short remove (**T[e]muudino** end of l. 6, **muunien[da]** end of l. 8), and could well have been influenced by it at any stage of composition, ordination, or even engraving.

11.2.f The data for **ee** and **oo**, while sparse, are entirely consistent with this picture: thus both **Feelic(i)** 723 and **Roomanus** (Tab. Alcant., **11.1.d** (xi) above), with Oscan-style geminatio in initial syllable, despite the stressed second syllable in each.[34]

11.3 *Geminatio in Other Lexical Items (I): aa, ee, oo, ii*

11.3.a Other lexical items beyond names can be described in much the same terms, except that several other factors come into play, as will be seen. Again, there are direct (and indirect) correspondences to be drawn with Oscan material, of which the most striking is perhaps

Lat. **aara** 1439	Osc. **aas-** (Ve 147A.16,
aaram 2238,[35] 3295	147B.1,19, Pocc 20)

[34] The obscure Marruc. **ąpoleenis** (Ve 218), noted by Lejeune ("Vocalisme" 242) as aberrant in this respect, probably has no initial **ą-** (Morandi *Epigrafia* 40 ad loc., p. 150), and the **-ee-** (cursive E, thus <IIII>) may not be correctly read, or may be erroneously spelled (see Coleman "Central Ital." 108 n. 35 on possible <I>/<II> confusions in this text).

[35] CIL p. 698 **aram**, corrected at p. 1098 and Degrassi *ILLRP* 751, cf. *Imagines* 293.

i.e. a lexical item of some cultural importance, and therefore another natural vector for such an orthographic practice. The following may also be noted:

Lat.	Osc.
aa(cetereis) 587	**aa(manaf(f)ed)**
ee 1221	**ee(stínt, -hiianasúm)**[36]
faato 1221 **famaa** 2662	**faama-**/-fααμα-[37]
faano 2676	**fíísn-**
haace 582	**paam.**[38]

11.3.b Lucilius' much-discussed disavowal of the Accian doctrine concerning geminatio (345-8 Krenkel = 352-5 Marx, VII.18.19-22 K [Ter. Scaur.]) has an interesting textual uncertainty. Krenkel, following the manuscripts fairly closely, prints as follows:

> *'aa' primum longa, <'a'> brevis syllaba: nos tamen unum*
> *hoc faciemus et uno eodemque ut dicimus pacto*
> *scribemus 'pācem', 'plăcide', 'Iānum'; 'ārīdum', 'ăcetum',*
> *ϒΑρες ϒΑρες Graeci ut faciunt*

It has not, to my knowledge, been noted before (despite the voluminous literature on this passage) that the words with long vowel Lucilius chooses by which to exemplify his own orthographic practice vis-à-vis geminatio

---

[36] Or perhaps rather **<v>ehiianasúm**, cf. Franchi de Bellis *Iovile* 141, although the strength of her argument that "La scarsa frequenza della geminazione vocalica in ambito capuano fa di *eehiianasúm* una lezione sospetta" (similarly 205 on the "rarissimo ... raddoppiamento vocalico") is in my view overstated.

[37] On -fααμα- see note 21 above.

[38] Cf. also Pael. *puus* 'qui' (Ve 213), although Lejeune ("Vocalisme" 242 n. 35) points out the possibility of graphic influence from the preceding *uus* 'vos'.

(i.e. *pācem, Iānum, āridum,* according to the MS readings) show certain striking correspondences with epigraphically-attested forms spelled with geminatio:

(i) all three words have *ā* (the most frequently-attested vowel spelled with geminatio);

(ii) the long *ā* in all three words appears in the initial syllable;

(iii) the examples reflect the two most common forms of words with geminated **aa**, i.e. two syllables with initial stress (*pācem, Iānum* like **aara/aaram, faato, naatam** etc., cf. n. 41 below), or three syllables with initial stress (*āridum* like **Paapia, Staatia/Staatius, Gaavia, Maamius**);

and perhaps most strikingly

(iv) the root syllables of both *pāc(em)* and *ār(idum)* are remarkably suggestive of two of the most salient items with epigraphic support for geminatio in both Oscan and Latin, i.e. Osc. **Paak-**/Lat. **Paac-** (cf. **11.2.b** above),[39] and Osc. **aas-**/Lat. **aar-** (**11.3.a** above).

It seems unlikely that these correspondences are due to chance (or metrical exigencies), and in this case it is noteworthy that in contrast to *pāc-*/**Paac-** and *ār-*/**aar-**, there are no attestations of ****Iaanus**. This may provide an additional argument in favor of Baehrens' otherwise attractive emendation *Pacideianum* for the *placide ianum* of the MSS (whence *placide Ianum,* as printed by virtually all editors), thereby eliminating *Ianum.* But the alternative suggestion *fanum* for *ianum*[40] is perhaps also worth considering, in view of **faano** (**11.3.a** above).

It can also be noted that the convergences between actual inscriptional usage and the Accian usages implied by Lucilius do not support Peruzzi's view (*Pesaro* 221ff.) that the main rationale behind Accius' system involved the disambiguation of desinential spellings (thus **-a** for nearly all first-declension desinences in Pisauran Latin), since

[39] Here note also **paaco** 'pago' 591 and **paagorum** 3269.

[40] So printed by Lazzeroni ("Geminatio" 124), despite his citation of GLK, where *Ianum* is printed; perhaps *fanum* is a misprint? (I have found an emendation *fanum* noted in no 18th-, 19th-, or 20th-century edition of Lucilius available to me.)

geminatio spellings for desinences are almost entirely alien both to Oscan and inscriptional Latin, and may have other rationales where they occur (cf. **famaa, magna[a]**, next section).

11.3.c For forms with **aa**, once again the overriding principle of distribution is better described as "initial syllable", rather than "stressed syllable". This accounts not only for all but two (or possibly three) of the two-syllable words, where initial position and stress coincide,[41] but also for all but one of the three- and four-syllable words: **paastores** 638, **paagorum** 3269, **aastutieis** 364, and the "phonological word" **aacetereis** 587.

Of the exceptions, **decoraat** 1570 once again shows an extension of the stress principle (cf. **Calaasi, T[e]muudino**, discussed above), with the interesting variation that the syllable marked with geminatio falls on a verse ictus, and not a "citation-form" word-stress: thus in 1570 (Naples, mid-1st c.), the final syllable of **decoraat** (a "contracted" 3sg. pf.) bears the ictus in the iambic senarius **ita.leíbertáte.illei.me.hic.me. decoraat.stolá**, in a poem where most long vowels (most of which also correspond to a verse ictus) are otherwise marked with apex. The exception **famaa** in 2662, the well-known elegiac epigram celebrating the exploits of Hirrus (Corinth, 101 or 102 B.C.), can be described in much the same way: **famaa** falls directly before the caesura in the pentameter line **noscite.rem.ut.famaa.facta.feramus.virei.** The evidence of this text, however, is somewhat more complex, since the pentameter line 8 may have begun with **magna[a]** (despite Degrassi's **magna**, *ILLRP* 342), as is now generally restored on the basis of space considerations.[42] It may be, however, that the "legitimate" (i.e. as an extension of the stress principle) ictus-type **famaa** has artificially induced the second ablative to be spelled

---

[41] **paaco** 591, **haace** 582, **faato** 1221, **naatam** 1221, **aara** 1439/**aaram** 2238, 3295, **faano** 2676.

[42] Thus Fränkel ad loc., CIL p. 740; for detailed analysis in terms of spacing see esp. S. Dow, *HSCP* 60 (1951) 91, as well as the photographs (e.g. Dow Fig. 1; Degrassi *Imagines* 151; Gordon *Introduction* 14, Plate 9).

magna[a], according to **a** principle of orthographic consistency that may well be operative in this document.[43]

11.3.c The evidence for non-onomastic **ee, oo**, and **ii** is simpler: with one exception, **all** forms are either monosyllables (**ee, ree** 1221) or two-syllable words with geminatio in initial syllable (**leegei** 582/**leege** 1439, **seese** 582, **seedes** 1202, 1529, **eemit** 3389, **feecit** [**11.1.d** (xii) above]; cf. **11.1.d** ad (xi) and (xiii) for **vootum, viitam**). The sole possibly early exception known to me is the somewhat doubtfully-attested **locaveerun**, in a lost inscription from Marsian territory (Letta-D'Amato *Epigrafia* 191, cf. also p. 94), which again would seem to show an overgeneralization of the stress principle.

11.4 *Geminatio in Other Lexical Items (II): uu*

11.4.a With **uu** (cf. in general Osc. **duunated, uupsens, fuutreí**), we find the monosyllable **iuus** 587 (3x), and **uu** in the initial syllable of two-, three- and four-syllable words, again regardless of stress:

2-syll.: **iuure** 2500, **uutei** 589 (Lex Anton. de Term.), **luuci** 582 (Lex Bant.), **luudos** 2944
3-syll.: **cuuriam** 3113
4-syll.: **muunien[da]** 808, **cuuraverunt** 2519

The sole exception is the class of *u*-stem forms with **uu** in final syllable (abl. **arbitratuu** 584.26 [Sent. Minuc.],[44] **pequlatuu** 587.I.5 [Lex Cornel. de XX Quaest.], acc. pl. **posteicuus** 780) — interestingly, the only pattern that continues to be attested with any frequency after geminatio per se disappears, together with new spellings **<-ii->** for *I* after **ei** drops out of use.[45] This exception is not easy to explain, although several further

[43] On certain strikingly consistent orthographic tendencies in this text (partly resulting from new readings) see esp. Dow op. cit. 96, who went so far as to conjecture (e.g.) [**bonaa**] for the lacuna at the end of line 8.

[44] Or possibly dat., see Petracco Sicardi "Sent. Minuc." 233.

[45] For attestations, see e.g. Dessau *ILS* 3;2.804ff. (esp. **-ii-**: **piia, siive, sacriis** etc.), 850 (esp. g. sg. **-uus**, on which see Leumann *LLuF* 442).

considerations regarding the other forms with **uu** may help to account for it.

11.4.b Consider first **iuus**, attested three times in this spelling in CIL 587 (Lex Cornel. de XX Quaest.; Rome, 81 B.C.) — a document, it should be noted, that is highly repetitive stylistically, and which is also relatively restrained in its orthographic archaizing tendencies. The first two attestations appear in I.39 and II.3, both times in the fixed phrase **iuus.lexque.esto**. Relatively soon thereafter follow four instances of abl. *iure*, in a variant of the same collocation — spelled, interestingly, without geminatio all four times: II.8-9 = II.12-13 **eo.iure.ea.lege ... quo.iure. qua.lege**. It seems hardly surprising, then, that the next instance of the nominative should follow the "modern" orthography established in the preceding four instances of **iure** (thus II.26 **ius.esto.licetoque**); nor, in view of the two initial instances of nom. **iuus**, does it seem surprising that the engraver (or the composer of the text) should then immediately (i.e. in the next line) revert to the geminated spelling in the next repetition (II.27-8 **iuus.erit | licebitque**), apparently considering his "**ius**" in II.26 to have been, if not an outright error, at least a less acceptable variant for the nominative (cf. also the immediately following **aacetereis** three lines later, in II.29). Thus, despite the frequent claims regarding the essentially arbitrary nature of spellings with and without geminatio,[46] the distribution of **iuus** and **ius** in this text can be taken as systematic, with **ius** a "deviant" spelling for the nominative, conditioned by the preceding four instances of iu**re**.[47]

11.4.c What is more puzzling, however, is the apparently systematic alternation nom. **iuus**/abl. **iure**. Descriptively speaking, **iuus** would appear to be a way of maintaining something of the archaic appearance of the older nominative spelling **ious** (e.g. CIL 583.12 [Lex Repetund.] etc., here also with **ioud-** passim, vs. transitional CIL 585 [Lex Agr.]: here e.g. 17 **ious ... ius ... ius**, 62 **adioudicari ... iudicato**), although for some reason this practice is not acceptable — at least in this text (cf. **iuure** 2500)

---

[46] For **iuus/ius** in 587, specifically e.g. Pepe, op. cit. 116.

[47] For the sequence (**iuus ... iuus ...**) **ius ... iuus** just discussed, compare the discussion of "archaizing corrections", **10.4-6**.

— for the ablative. In a similar way, the **uu** of **cuuraverunt** 2519.5 approximates the visual "weight", so to speak, of the archaic and archaizing diphthongal spellings **coir-/coer-** (cf. 2519.9 **coeravit**), and the same can be said for **muunien[da]** 808 (early 1st c.) vis-à-vis **moen-/moin-**, **uutei** 589 (Lex Anton. de Term., 71 B.C.) vs. **oet-/oit-**, and **luudos.fecere** 2944 (Capua, 108 B.C.), cf. the approximately contemporaneous Capuan attestations **loedos.fecerunt** 2946, **lud[os.fecer(unt)]** 2947.[48] It ap-pears, then, that **uu** has a certain development as an archaizing feature characteristic of the Rechtsprache of the late second and early first centuries.[49] It is in this general context, then, that the *u*-stem ablative spelling **-uu** can be understood in **arbitratuu** 584.26 (Sent. Minuc.; here also **Muucio** 3x), and **pequlatuu** 587.I.5 (Lex Cornel. de XX Quaest.; here also **iuus** 3x and **aacetereis**, cf. above), whence, by analogy, **posteicuus** 780 (here also **Vaarus**) in a mid-first-century public notice.[50] Here again, one can also invoke the greater "body" of archaic fourth-declension variants (abl. **-ud**, gen. **-uos**), similar in principle to **iuus/ious** (vs. **ius**), **cuur-/coer-/coir-** (vs. **cur-**), etc. Interestingly, this "mirror-image" extension of the normally initial-syllable **uu** to the final syllable (which, strikingly, does *not* conform to a stress principle) did not lead to usages in medial position, apart from the unique **T[e]muudino**: thus never ****pequunia** et sim.[51]

11.4.d As a relatively rare and clearly optional feature, geminatio vocalium is generally conceived of as having been applied (or not) in essentially haphazard ways, i.e. in accord with Ernout's influential dictum concerning the orthographic vicissitudes of Archaic Latin inscriptions (cf.

---

[48] Similarly also **luuci** 582 (Lex Bant.), vs. **louc-**.

[49] One is reminded of certain so-called "juridical" features, partly involving some of the same forms: see Leumann *LLuF* 65f. on the diphthong of *moenia, poena, foedus*, and 378 on the complex *s*-stem formation *-nus* in *fūnus, mūnus, pignus* etc.

[50] The odd *u*-stem inflection of **posteicuus** here is itself no doubt secondary (Leumann *LLuF* 340, 443).

[51] The spelling *serituu* at Tab. Ig. VIIa 15 is unique for this word (as noted, for example, by Meiser *Lautgesch.* 137, although not recorded in Prosdocimi's apparatus, *Tavole* ad loc.), as against 29[illegible] times spelled *seritu* in VI and VII (also **seritu** IIa 24), and indeed (as Meiser observes) as against imperat. *-tu* so spelled more than 160 times altogether in the Latin-alphabet portions of the text. While *serituu* is thus clearly aberrant, from the Umbrian point of view, it is not unthinkable that such a spelling is related to the Latin type **-tuu** of **arbitratuu, pequlatuu**, cf. also (imperat.) **azeriatu** (Ib 8), *aseriatu* (VIb 47).

§4 of the "Introduction"). Certain regularities, including the propensity of some names, lexical items, and even case forms to make use of geminatio (or not) in accordance with Oscan parallels (and also, one presumes, traditional family spellings), phonetic patterning, and other factors have already been noted at various points above, and there are still other regularities to be found. Thus, as with **iuus** vs. **ius** in CIL 587, Pepe (loc. cit.) likewise cited the alternation **Muucio/Mucio** in CIL 585 (Lex Agr.) as another instance of the fundamental arbitrariness of the notation of geminatio. But the actual disposition of the attestations themselves in this text suggests that the distribution of these forms is anything but arbitrary:

1 **Muucio**
4 **Muucio**[52]
13 **Muucio**
15 **Mucio**
27 **Mucio**
28 **Mucio**
29 **Mucio**
33 **Mucio**

A glance at the photographs (see Degrassi *Imagines* 385) shows that the relatively large letter-size and broad spacing between words typical of the opening lines gradually gives way to smaller and closer lettering, which by line 40 has reached a significant degree of compression. This progression is most clearly visible in Degrassi's photograph 385b, which also shows that this tendency toward compression begins to manifest itself precisely at line 15, i.e. exactly where **Mucio** (as opposed to **Muucio**) begins to be spelled.

11.4.e Similar in principle (although something like the reverse of the above) is the case of CIL 638 **paastores**, which occurs at line-end in a text that operates with an extremely precise right margin, and that makes use of space punctuation only at sense breaks: thus the exercise of the geminatio option here can very likely be viewed (at least in part) as a space-increasing strategy, whatever other resonances such a spelling may

[52] Here actually **MNVCIO** [sic], clearly for **MVVCIO**.

have (cf. **6.2.d**). Significantly, the version chosen was neither ****pastoores** nor ****pastorees** (either of which would have lengthened the word sufficiently, and either of which might have been predicted according to other views about the nature of Latin geminatio), but **paastores**, in precise accord with Oscan orthographic conventions.

CHAPTER TWELVE

Ligatures

12.1 *Ligatures in Archaic Latin Inscriptions*
12.2 *Ligatures and Non-Urban Palatalized Segments (I): Introductory (Pael. Ð, Lat.-Umbr. q); Praen. Ɛ (CIL 60) and Campanian Lat. Ɛ (CIL 400)*
12.3 *Ligatures and Non-Urban Palatalized Segments (II): Lat. -NI̲E̲ and Pael. -N-*

12.1 *Ligatures in Archaic Latin Inscriptions*

12.1.a The standard epigraphical works have very little to say about ligatures, especially in early Republican inscriptions. In general, the use of ligated characters is viewed as having been at first mainly an expedient arising from lack of space at line-end (see e.g. Gordon *Introduction* 37), only later developed in aesthetic or monogrammatic ways, to a greater extent in some Imperial provinces than others.[1] Otherwise, some works provide listings of the ligated characters in general use,[2] although these are generally incomplete, certainly with regard to early variants. As for specifics of chronology and usage, most handbooks merely provide a version of the following statement (sometimes even reduced still further), from Sandys' classic manual (*Lat. Epigr.* 53, essentially following Hübner): "This practice first appears on coins about 200 B.C. and in inscriptions about 150."[3] There is more to be said, however, about the distribution of

---

[1] The doctrine on ligatures articulated by Hübner (*Exempla* lxviii) has remained essentially unchanged; for more on late localizations see e.g. Gordon and Gordon *Contributions* 76, Meyer *Einführung* 42.

[2] See esp. Hübner *Exempla* lxviiif., Cagnat *Cours* 24.

[3] Cf. Meyer loc. cit. (but with an unfortunate typographical error (bis!): "Diese Sitte taucht in Italien auf Münzen um 200 n. [sic] Chr. auf, in Inschriften um 150 n. [sic] Chr., bleibt aber in der Zeit der Republik seltene Ausnahme."); similarly Fedorova *Lat. èpigr.* 63, Wachter *Altlat. Inschr.* §204f with n. 1013. Di Stefano Manzella *Mestiere* 149ff. provides mainly technical vocabulary for describing ligatures, among other methodological remarks, with almost no discussion of chronology. Almar (*IL* 39ff.) omits all mention of chronology, noting only the traditional dogma concerning lack of space (esp. at line-end), and decorative usages; similarly (but even more superficially) Calabi Limentani *Epigrafia* 148.

ligatures in early inscriptions (**12.1.b-d**); moreover, there is an entire category of linguistically interesting early non-Latin ligature usages that is generally neglected, but that nevertheless makes its appearance in Latin inscriptions as well (**12.2-3**).

12.1.b Note first that a ligature on an object that is not a coin is attested before 200 (and perhaps well before that date), on a vase fragment assigned to the period from the mid-fifth to mid-third centuries (CIL 2916m/l **af**, see CIL p. 900 for facsimile, from Colonna *Lap. Sat.* p. 59 Fig. 6, no. 17/l; photograph Plate 16.3).[4]

Secondly, the handbook restriction to "coins" (for the earlier examples) is misleading in another way: what is involved is essentially a correlation with size, including many other types of small objects in which space is at a premium and a short text (often onomastic) must be inscribed in some form, whether abbreviated or not. Thus ligatures are not uncommon on such objects as lanterns, rings and other gemstones, and vase-seals; to consider only the first, names (or abbreviations of names) appear with ligated characters in the lantern-inscriptions CIL 519, 520, 521, 533, 535, 536, and 544 (e.g. 544p, 544q, 544s), of which several have evident paleographic indications of antiquity — note the relatively frequent use of open A (as in 519, 521, and several of the single signs of 544), and especially open A together with angled L and inclined N in 521 **L.Manilio.**[5] Even in some "compressed" formats where ligatures are commonly attested mainly in later Republican times — as notably in Pompeiian programmata — the repetitions of particular ligated usages suggest that some of these graphic habits have a relatively long tradition of usage behind them.

---

[4] There are other early candidates from vase fragments more difficult to date, e.g. CIL 3569/74 and 3593a, both with signs interpretable as M+V ligatures, although five-stroke M remains a possibility; cf., however, 3587c **MV**, beside other abbreviations spelled with ligatures in the parallel pair 3587a-b.

[5] Even when, as in 544s, the precise solution for the ligated character(s) is unclear, open A is itself beyond question: thus 544s could in theory be resolved as AI, AN, NA, NAI (etc.), but in any case with open A; similarly with the frequent ligatures in the vase-seals from Minturnae (CIL 2880, angled L), or Capena (2496, open A), etc.

12.1.c It can also be noted that one of Wachter's recent new readings provides an interesting ligature for the late third/early second century, although Wachter does not take special notice of the ligature per se. In his analysis (*Altlat. Inschr.* §213d) of the bronze dish inscription CIL 2391,[6] Wachter has persuasively rejected the nonsensical reading **Maisio** (in addition to CIL, Degrassi, Warmington etc., maintained also by Salomies, *Vornamen* 86), and the inscription can now be read as **A. Septunolena.Petr.Numisio.dono**, i.e. 'A(ula) Septunolena Petr(oni uxor) Numisio (sc. Martio) dono'.[7] Wachter does not make clear, however, exactly how the six-stroke sequence representing /Num-/ — which looks like the first two strokes of (an inclined) N followed by a (slanted) four-stroke M — is to be interpreted graphically, for which there are in theory two possibilities, namely (i) a triple ligature "N+V+M", with the V included (i.e. as the second and third strokes), or (ii) a double ligature "N+M", thus implying a spelling **N(u)m**-, with syllabic notation. Further consideration of this indeterminacy is reserved for the discussion of syllabic notation, **14.2.b** below.

12.1.d Another relatively early ligature of some interest has gone almost entirely unnoticed, i.e. the M+A (NB: closed A!) ligature in the "original version" of CIL 366 (Lex Spolet.) II.4 **malo**.[8] Although the third-century dating of this inscription is still promulgated in CIL I^2 fasc. 4,[9] such a ligature in such a text (cf. **4.7.c** above) supports Wachter's contention (on other paleographical grounds) that the inscription is not likely to be older than the Senatus Consultum de Bacchanalibus (cf. **7.8.b**

---

[6] Pp. 710, 1147 (Ritschl *Prisc. Lat.* 2H), origin unknown; Degrassi *ILLRP* 1238, Warmington *Remains* p. 210.

[7] Wachter correctly points out (loc. cit. with n. 1039) that previous doubts as to whether the name **A(ula).Septunolena** could refer to a woman (cf. Degrassi, Warmington) are unfounded, given the frequency of names in *-olenus/-ulenus,* including **Septumulenus** (CIL 1698). It can now be added that **A.** = *Aula* is not unique, despite explicit assertions to the contrary (see CIL p. 710 and Degrassi), in view of the new attestation CIL 2848 **A.Decemia**.

[8] CIL p. 405 with facsimile (reprinted also in Prat *Ablatif* 23), cf. Degrassi *Imagines* 380c.

[9] P. 877: "Cippus positus esse videtur non multo post coloniam Latinam Spoletium a. 241 deductum".

above).[10] Nevertheless, this form seems to provide a bona fide instance from the early (or, at latest, mid-) second century, i.e. among the oldest ligature attestations outside the "compressed" formats noted above.

12.2 *Ligatures and Non-Urban Palatalized Segments (I): Introductory (Pael. Ð, Lat.-Umbr. ḍ); Praen. Ͼ (CIL 60) and Campanian Lat. Ͼ (CIL 400)*

12.2.a In contrast to the above more or less standard uses of ligatures as devices for orthographic compression, there is another — if much rarer — form of ligature usage that is less well known, but of no small interest, especially for archaic texts: I refer to a small set of characters originally derived from ligatures, and used to spell palatalized segments in some (mostly) non-Latin Italic contexts. These characters and their history have been noted individually, and some limited comparisons have been drawn among them; but the range of phenomena to be interpreted in this way can be expanded to include several additional forms — not surprisingly, onomastic ones — occurring in (non-urban) Latin documents, which in turn allows for a more comprehensive view of this early form of ligature usage.

The most familiar character of this sort is the Paelignian <Ð> sign (Ve 213, 4x: *Petieđu, viđad, Vibđu, afđed*), generally assumed to reflect a phonetic /ž/ or /z/ via palatalized /d'/ (see Jiménez Zamudio *Peligno* pp. 22f. for discussion). As Vetter has noted (p. 147), this character no doubt arose as a D+I ligature, to which Vetter compares what looks like a C+I ligature in the Latin inscription CIL 1898[11] (= Ve 240a3) from Umbrian territory (Picenum): here the names **Petruc̣idi** and **Pac̣idi** evidently correspond to Umbr. *Petruśidi, Paśidi,* with palatalized segments that would be spelled in the native Umbrian alphabet with the <ḍ> letter, itself

[10] The preserved portions of the (not quite identical) "duplicate" or second version (CIL 2872, Degrassi *Imagines* 381) contain no ligatures, although this interesting difference between the two versions is generally ignored.

[11] P. 668, with photograph.

originally derived from a C+I ligature (on which see Bottiglioni *Manuale* 14, with further references).[12]

Graphically, there is no surprise in the "fusione del segno della vocal palatale per eccellenza" (Bottiglioni) with D (for /d'/ > /ž/ or /z/) and C (for /k'/ > /š/ or /s/); but it should also be noted that the I-sign can apparently be oriented either horizontally within the character for the preceding consonant (as in <Ɒ>), or vertically after it (as in Umbr. <ɖ> and the Latin character based on it).

12.2.b We are now in a position to consider an interesting orthographic problem (or rather, complex of problems) in the third-century Praenestine bronze CIL 60 (cf. **3.4.a** with n. 89).

The well-known difficulty concerning the reversed C of CIL 60 **Primo.ɔenia** (similarly CIL 457 **Ɔemeni**) has been analyzed in detail by G. Giacomelli (*JIES* 1 [1973] = *FS Poultney* 309ff.). She makes the attractive suggestion that this notation represents not a plain /g/ (cf. CIL 60 **cratia**), but a palatalized segment, to be compared with the same reversed-C notation used for the palatalized segment of Volsc. *façia* (Ve 222, Tab. Velit.), from Velletri, not far distant from Praeneste. The major difficulty with this theory, however, concerns the form generally transcribed **Orcevia** in CIL 60: it seems decidedly odd, as Giacomelli notes (314), that palatalization would not be recorded in **Orcevia** as well, since "the circumstances of the occurrence of the inverted letter and of the regular one in ORCEVIA are identical: the same palatal vowel follows the velar in each case". To remedy this difficulty, Giacomelli is forced to propose that the graphic distinction is related to the difference in voicing between the two velars — a "costly" assumption, as she herself admits. Indeed, as Wachter notes in his critique of Giacomelli's account (*Altlat. Inschr.* §84i), the Volscian orthographic comparandum itself involves precisely a phonetically voiceless velar (cf. **Orcevia**), which renders Giacomelli's hypothetical voicing distinction that much more unconvincing. Wachter goes on to observe, however, that there is at least one piece of evidence

[12] For the comparison with the Umbrian character see already CIL loc. cit. (Pascal); note also the Lat. variants **Petrusidius, Pasidia** there cited (for *Petrusidii* now also *AE* [1985] 354), beside **Petruc-, Pac-**.

suggesting that the velar of **Orcevia** may in fact have had a special pronunciation of some kind, namely the fact that the C in this word contains an internal stroke that is unlikely to be due to chance. Giacomelli (op. cit. 311 n. 12) had referred to this as a "dot, which has ... been considered accidental since the first publications". Wachter (n. 590) correctly notes that this marking is clearly not a dot, but rather a stroke (as is evident from the photographs, including the one printed by Giacomelli, p. 310; cf. also Wachter's facsimile), and he further compares this character with the Paelignian Ð-sign of Ve 213 (cf. **12.2.a** above). He concludes, however: "Leider gibt es m.W. für ein solcherart modifiziertes C (noch) keine Parallelen". But there is a potentially interesting (and, so far as I know, hitherto unnoticed) parallel to be found, which requires more extended discussion (**12.2.c-e**).

12.2.c The archaic Campanian inscription CIL 400 (ager Falernus, near Francolise)[13] is transcribed as follows in CIL:

R.Vẹḍo[
V.Autroḍiu C.
S.Racectiu.S.
S.Teditiu.S
statuendos
locaverunt

The character in question is the first C of **Racectiu** in line 3, which must nevertheless be considered together with a number of striking features this inscription shows (several of which likewise concern the names of the magistrates in lines 1-4), and other traits indicative of certain "dialectal" influences.

Not only is the praenomen **R.** unusual,[14] but of the gentilicia, only **Vẹḍo[** (if this reading is correct) and **Teditiu** appear to have possible (but

[13] Pp. 409, 882 (photograph at CIL X 4719); Degrassi *ILLRP* 483, Warmington *Remains* p. 156.
[14] CIL p. 882 and Warmington *R(etus)*, cf. CIL 412 (Cales) **Retus**, 2496.2 (Capena) **R.Au**, rather than *R(ullus)* or *R(ufus)* (CIL p. 409), but see now Salomies *Vornamen* 88 (*R(ufus)*).

not exact) comparanda,[15] while **Autroḍiu** and **Racectiu** are almost entirely isolated.[16] For the names in lines 2-4 (and no doubt also in line 1), note further the remarkable patronymic expressions without *f(ilius),* "ex more Oscorum" (cf. **4.1.b** above). In addition, note that lines 2 and 3 end not with the letter abbreviating the patronymic, but with line-final puncts, which can be compared with the same practice in Oscan (cf. **4.3.e** above with n. 39): thus CIL 400 (line 2) **V.Autroḍiu C.** | like Osc. **mr.spurịịeís l.** | (Ve 25.4), in an *eítuns*-inscription which makes use of this practice in at least three of its six lines.[17]

12.2.d Unfortunately, the dating of this inscription is in some respects controversial. It is clear, at any rate, that in addition to all of the above features, there are several others that point generally to an "archaic" date: (a) the appearance of four *magistri,*[18] (b) the omission of *terminos* (or *cippos*) in the phrase **statuendos | locaverunt** (CIL p. 410: "vetustissimo more"), and (c) several facts related to the letter forms. These latter require more detailed comment, not only because of the evaluation of the C-character under discussion, but also because the CIL treatment is misleading or inaccurate in certain respects.

In general, the photograph reveals a somewhat crude and uneven style of engraving, which, together with some of the odd letter forms themselves, seems consistent with the CIL judgment "litteris antiquissimis". Among the more significant letters (in terms of dating): note that L (in **locaverunt**) is clearly angled. CIL prints upright N for both **statuendos** and **locaverunt**, but the situation is not entirely clear. In **statuendos**, the

---

[15] *Ved-:* e.g. *Vedius, Vedusius, Vedonius* etc. (Schulze *Eigennamen* 101, 251); *Ted-: Tedius, Tedusius, Tedasin(ius)* (Schulze 251, 373, 384).

[16] For **Autroḍiu** (for which, according to Mommsen, **Autroḅiu** is also possible), cf. (?) *Autronius* (Schulze 257 n. 5); for **Racectiu**, cf. (?) *Racilius* (Schulze 443).

[17] Jordan's failure to notate the line-final puncts in his transcription of CIL 400 (*Quaest. arch.* 9) reflects a curious oversight, despite his evident care in examining the photograph (see the discussion of the C-sign in **12.2.e** below); it is symptomatic, however, of a certain disregard, on the part of some nineteenth-century scholars, for details of punctuation (cf. **4.3.e** n. 37 concerning von Planta's and Conway's Paelignian transcriptions). The CIL transcription of this feature, which I have checked against the photograph, is quite exact.

[18] See CIL p. 410 for discussion; cf. also the archaic (but unfortunately fragmentary) Campanian inscription CIL 2874b (p. 882; Cales, 3rd/2nd c.) **C.Calp[| C(.)Apru[| L.Calpụṛ[| L.Viḅio[**, which at least begins the same way.

central portion of the N has unusual rounded transitions at both top and bottom, and in **locaverunt**, the leftmost stroke of the N appears to be inclined. As for R: CIL describes open R for **locaverunt**, as opposed to closed R elsewhere; but this is not borne out by the photograph. Although the R of line 1 is difficult to make out, the R's in lines 2 and 3 appear to be open as well.[19] Indeed, the clear open R of **locaverunt** was taken by Mommsen (see especially the discussion at CIL X 4719) as a piece of evidence (together with the onomastic data and the omission of a word like *terminos*) pointing to a (late) third-century date. Strictly speaking, however, open R cannot be used as an independent dating criterion, as Wachter has shown (*Altlat. Inschr.* §155c), and the same could be said for the consistent open A's (see Wachter §154c).[20] Nevertheless, all of the features described above are certainly consistent with a late third-/early second-century date, and suggest, in any case, a date not later than about the mid-second century, despite the omission of CIL 400 from Wachter's corpus.[21] By way of comparison, one may also note the striking similarity between the lettering of CIL 400 and that of the archaic inscriptions from Marsian territory (near Trasacco) CIL 2873c[22] and 2873d,[23] both likewise with open A, a very similar open R, and cursive E, and both dated to the late third century (see CIL ad locc.).

12.2.e As for the C-sign in question: the special nature of this character is clear from the CIL annotation (p. 409): "quarta littera magis C quam F (ut voluerunt Garr., Zang.), cum virgula obliqua Ϲ casu accessisse videatur". Compare Jordan's transcription "**Racectiu** vel **Rafectiu**" in his detailed study of this inscription (*Quaest. arch.* 9), and his comment (p. 10) on the reading of line 3: "tertiam nominis F esse et Zangemeister et Garruccius putant, C Mommsenus: virgula obliqua in medio elemento mihi

[19] The circular depression directly above the open R of line 2 gives the impression of being the upper portion of a closed R; but under this interpretation, the R would extend significantly above the line, whereas letter heights (at least within individual words) are generally quite even.

[20] Still less probative — but of some interest in connection with the C-sign, as will be seen — are the consistent cursive E's.

[21] It figures only in a list of attestations of *Vibius*, which, as Wachter shows (n. 555B, p. 519), is most prominently attested in Oscan-speaking territory.

[22] Photograph in Letta-D'Amato *Epigrafia* Tav. 48 (no. 135).

[23] Facsimile CIL p. 880.

quoque photographum exemplum examinanti potius casu expressa esse videtur". Nonetheless, this "virgula obliqua", together with the rounded left side of the character (which is indeed more consistent with C than with F), produces a character virtually identical to the Ȼ (with "virgula obliqua") of CIL 60 **Orcevia**. Here again, the character in question is followed by **e**, while plain C appears in pre-consonantal position in the same word (i.e. **Racectiu** spelled **RAȻECTIV**), and before **a** (**locaverunt**, and abbreviated **C.**), cf. CIL 60 **cratia**. It seems quite possible, then, that both **RAȻECTIV** and **ORȻEVIA**, in markedly non-urban texts, make use of the same special character to notate a voiceless palatalized velar.[24] Graphically, this C+I character is in effect the "horizontal" equivalent of the native Umbrian C+I <ḉ> sign, i.e. with the I-sign oriented horizontally within the C-sign, exactly as in Pael. Ɗ (cf. **12.2.a** above).

In theory, one could claim that such a C-sign is actually a C+E ligature (in view of the horizontal stroke), which in the case of **Orcevia** might indicate a spelling intended to reproduce **Orceevia**, with geminatio vocalium. Although neither Hübner nor Cagnat, for example, lists such a C+E ligature, this character can in fact be found, at least in a (relatively late) Veneto-Latin context (*MLV* 222-10 *Marcellinus*, see *LV* Ca VII ad loc., with facsimile).[25] But such an interpretation is highly unlikely for **Orcevia**,[26] and all but impossible for CIL 400 **Racectiu**, where **e** is spelled not with E, but with II (cursive E). Unless the "virgula obliqua" in both cases is accidental (which seems unlikely), it appears preferable to assume the existence of a special character within the same non-urban "I-ligature" tradition (for spelling palatalized segments) noted above for Pael. <Ɗ> and Umbr. <ḉ>.

---

[24] For a more general discussion of the palatalization of velars as an areal phenomenon, including possible Sabine evidence, see R. Giacomelli, *Graeca Ital.* 119 n. 18.

[25] Despite the extraordinary thoroughness of *MLV* in most other orthographic particulars, it should be noted that the recording of ligatures therein is incomplete and inconsistent (cf. also **15.2.a** n. 8). In the present case, neither of the two ligatures M+A or C+E is noted in Lejeune's transcription, or mentioned in his description.

[26] For the probable original diphthong in the second syllable, see Wachter *Altlat. Inschr.* §84b, and for the various chronological and orthographic facts about geminatio vocalium that render such a spelling virtually impossible for (the second syllable of) CIL 60 **Orcevia**, see Ch. **11** passim.

12.3 *Ligatures and Non-Urban Palatalized Segments (II): Lat. -NI̯E and Pael. -N-*

12.3.a In a way somewhat similar to the problem discussed in **12.2**, another isolated (and relatively early) ligature can perhaps be better understood in the context of parallel forms that may have palatalized segments.

The mid-second-century bronze plate from Etruria CIL 1998[27] contains an onomastic sequence traditionally read as **Taniae Detrone.** Wachter (comparing CIL 1412 **Petroniai ... Tanniai**) is surely correct in taking **Detron-** to reflect **P̣etron-**; more interesting, however, is his observation that the vertical of the second E of what appears to be **P̣etrone** extends both above and below the top and bottom horizontals (unlike the other five E's in this text), which allows the character to be taken as a ligature I+E, yielding the more plausible reading **P̣etroni̯e.** It is noteworthy, however, that the rather more common N+I ligature (cf. Hübner *Exempla* lxix, Cagnat *Cours* 25) is not used, in favor of the unusual I+E type (listed by neither Hübner nor Cagnat). It is at least possible that the orthography is attempting to capture something other than (four-syllable) /Petromie:/ (which would have been notated by the N+I sign), namely a pronunciation on the order of (three-syllable) /Petromye:/ or (palatalized) /Petrom'e:/. This, in turn, is reminiscent of the problematic Fal. **pop.petrunes** 'Pub(lia) Petronia' (Ve 322c, Giac. 121.III): however the ending **-es** is to be explained,[28] the orthography may reflect a palatalized stem /Petrum'-/.

12.3.b The same ambiguity is attested for this name outside Etruria as well, namely in Paelignian territory: *Vib.Ptruna* 'Vib(ia) Petronia' (Ve 215q).[29] While Vetter and others take the -N- to reflect a palatalized /-n'-/, M. Lejeune (*RPh* 49 [1975] 181 n. 2) prefers to interpret rather as a ligature N+I. The photograph, however, shows nothing to support this

---

[27] Pp. 676, 1073 (near Orvieto; Ritschl *Prisc. Lat.* 4C); Degrassi *ILLRP* 1268, Wachter *Altlat. Inschr.* §206 (cf. **4.5.a** on the form of the desinence).

[28] See Giacomelli *Lingua fal.* p. 148 for discussion; more recently also R. Coleman, in *IE Numerals* 424.

[29] Jiménez Zamudio *Peligno* 35, CIL 3246 (p. 1040; photo tab. 82 fig. 5).

idea. Lejeune compares CIL 3257 (Pael.) *Licina* 'Licinia', where de Simone had likewise seen a ligatured N+I (followed by Jiménez Zamudio *Peligno* 46); but again, the photograph (CIL I[2] [fasc. 4] tab. 85 fig. 4) seems to me not to favor this interpretation, as Krummrey has noted ad loc.[30] It seems preferable to assume for Pael. *Ptruna, Licina* (as also for Fal. **petrunes**) a palatalized pronunciation, here without ligature notation but instead lacking the I-sign.[31] This same pronunciation could also be reflected in the unusual I+E ligature of CIL 1998 **Petronię**, as suggested above.

[30] P. 1043: "*Licinia* litteris NI conexis legit de Simone, <cf. Lejeune ad n. 3246, sed hasta dextra litterae N non nisi paululo altior est sinistra; ceterum quod ad altitudinem litterarum attinet titulus non constanter sculptus est>".

[31] On the regular Oscan palatalizations, see Meiser *Lautgesch.* 197f., and 199 for Paelignian (without mention of *Ptruna, Licina*); for Paelignian note also Ve 209 *pelegię* 'pellege' (see Jiménez Zamudio *Peligno* 8 for the reading), either with palatalized /-g'-/ (cf. Wallace *Sabellian* 89) or a *ię/o*-formation (Pisani *Lingue* 46 ad loc., as a second possibility).

CHAPTER THIRTEEN

Word-Division at Line-End

13.1 *Introductory*
13.2 *Word-Division at Line-End in the Forum Inscription*
13.3 *"In Latere" Division*
13.4 *"Overhanging" Patterns*
13.5 *Notes on Critical Applications*
13.6 *"Anti-Syllabic" Division*

13.1 *Introductory*

13.1.a The title of Dennison's classic study of word-division at line-end in Latin inscriptions[1] accurately reflects the conceptual limitation of Dennison's concern: his analysis of a fairly compendious collection of word-divisions was intended to evaluate the statements of the Roman grammarians concerning "correct" syllabifications of Latin words, especially those with clusters, of the types *fru-ctus, i-pse, no-stri*, etc. Later studies of Latin syllabification have added no new material, and have based themselves largely on Dennison's work for their inscriptional analyses.[2] Nevertheless, Dennison excluded volume I of CIL from his corpus, and provided only the most limited assessment of word-division practice in Republican inscriptions (see esp. "Syllabification" 62f.), the essential points of which are worth citing:

> Inscriptions of a public character, inscriptions of a relatively early date, and those which are made with evident care, show a marked tendency to avoid breaking words at the ends of lines. ... When a division does occur in these three classes of inscriptions, it is nearly always a correct one. On the other

[1] W. Dennison, "Syllabification in Latin Inscriptions", *CP* 1 (1906) 47ff. (hereafter cited as "Syllabification").
[2] See esp. H. von Helle, *Glotta* 11 (1921) 29ff., Hermann *Silbenbildung* 231ff.

> hand, private inscriptions of a late date, and carelessly made inscriptions of even an earlier period, show numerous line-divisions, and these often violate the regular rules of syllabification. ... A study of data earlier than Julius Caesar shows that inscriptions antedating the last half of the first century B. C. rarely admit divisions of word by line.

The last statement is then supported with reference to a small selection of datable legal texts. Similar conclusions and concerns are voiced in other epigraphical discussions: thus Gordon and Gordon (*Contributions* 206f.) find that for the Augustan and post-Augustan materials they survey, word-division at line-end is "proper ... only in reasonably long, narrative-style inscriptions containing complete sentences and set up in paragraph form", and the same point is made by Calabi Limentani (*Epigrafia* 150), although without chronological indication. In general, unexpected divisions are (perhaps inevitably) described via negative value judgments (cf. Dennison above on "carelessly made inscriptions"): syllabifications that violate Dennison's rules are judged to be "peculiar", and said to "mar" otherwise handsomely-carved texts (Gordon and Gordon loc. cit.), and the various strategies designed to avoid line-end word breaks (such as ligatures, or the use of smaller characters, among others) are dismissed as resulting from "inferior arrangement" (Gordon *Introduction* 37).

13.1.b This overriding concern with aesthetics, while of indubitable value for Imperial, Augustan, and even late Republican productions, is of much more limited utility for earlier material, before the crystallization of many of the aesthetic norms associated with later texts.[3] Thus, characterization of certain word-division avoidance strategies as "anomalous", "careless", or restricted to private documents generates misleading (and in part also false) impressions: as will be shown below, some such strategies are relatively well-attested on public documents, and in a certain sense reflect acceptable technical variants for which such negative value judgments are fundamentally inappropriate. In addition, as with various other paleographic features characteristic of the early period,

[3] Cf. the discussion of indentation and centering practices in **3.c-f** above.

more precise characterizations of some of these techniques reveal certain geographical restrictions, which are both interesting in themselves and of some potential value for the resolution of text-critical problems. After considering a surprisingly early possible instance of a form of "standard" word-division, some of the above issues are explored with reference to several "non-standard" line-end formats.

13.2 *Word-Division at Line-End in the Forum Inscription*

13.2.a Apart from a vague observation by Palmer,[4] I know of no specific discussion of the question of line-division (especially as it involves divisions within words) in the Forum Inscription, prior to Wachter's brief treatment, offered in the context of his discussion of line-division in CIL 5 (*Altlat. Inschr.* §222f). As Wachter notes, the interesting practice of CIL 5, based on a principle "Zeilenanfang = Normalsilbenanfang" (see Wachter §169b: thus *-vio / sa-* in 1-2 **Cantovio | s.Aprufclano,** *cei / pa-* in 2-3 **cei | p.apurfimem,** etc.), seems to be an innovation: the only comparable (i.e. multi-line) inscription (boustrophedon or otherwise) from an earlier period is precisely the Forum Inscription, which does not appear to show the same technique (cf. 2-3 **es | ed**), "neben einigen 'Zufallstreffern'".[5] But what precisely are the "chance occurrences" of this pattern, and what can be said otherwise about the nature of line-division in the Forum Inscription?

13.2.b The clearest instance of a CIL 5-type division appears between lines 11 and 12, to judge from the **]m:** that begins line 12 (cf. **1.1.c**), implying a division 11-12 **[-a/i/e/o/u] | m:i-**, cf. CIL 5 **doṇo | m.a-** (6-7).[6] Interestingly, this "chance occurrence" of this division style

[4] "... the stonecutter three times observes a standard of word division between lines" (*King and Comitium* xii; standard and lines not specified).

[5] This persistent feature of line-final division in CIL 5 may help account for the false internal division **e | salico.menur | bid** (for expected **e | salicom.enur | bid**) in lines 3-5, according to the usual interpretation of this phrase.

[6] The **A** seen by Palmer at the beginning of line 12 of the Forum Inscription (whence his **am** 'circum', *King and Comitium* 21) is imaginary: the diagonal stroke preceding the **M** — which does not appear in the rendering or description by Comparetti, is not noted in the otherwise scrupulous catalogues of adventitious marks etc. by Goidànich, and which

occurs precisely at an otherwise problematic locus, namely the "spilled over M" spanning the two consecutive right-to-left lines 11 and 12, as discussed at several points in Chapter 1 (see esp. **1.1.c, 1.4.g-h**).

13.2.c Elsewhere in the inscription, we find the following patterns:

(i) line-end = word-end:
4 **..ḷas,**[7] cf. 5 init. **recei**
6 **]evam,** cf. 7 init. **quos**
15 **iovestod,** cf. 16 init. **loi{ụ}quiod**

(ii) line-end at syllable boundary:
8-9 **kalato | rem**
10-11 **iouxmen | ta**
13-14 **ha | velod** (? cf. **13.2.d** below)

(iii) "etymological" division:
2-3 **es | ed**

and never (except 11-12, as described above) **eva | m, ese | d, iouxme | nta / iouxm | enta / iouxment | a,** etc. That is, with the exception of lines 11-12, the patterns of word-division at line-end in the Forum Inscription may not in fact be governed by chance: despite the boustrophedon format, they already correspond, in all essential particulars, to the "standard" system typical of Roman official documents in much later times (cf. **13.1.a** above and further **13.6** below). In this sense, it would be preferable to take the behavior of lines 11-12 not as a "chance occurrence" of the CIL 5 type of division, but as a real aberration. The exceptional status of this division, then, might be a further indication that the M has

appears most clearly only in photographs of the plaster casts — is in any case certainly *in margine* (cf. **1.4.f** on the otherwise regular "vertical orientation"), and can be taken as a letter trace only with the greatest difficulty. Dumézil (*Latomus* 29 [1970] 1041 n. 2) properly argues against Palmer's preposition ạm on linguistic grounds, but his own **[enpolut] | ọm** or **[vi] | ạm** (1044 with n. 6) is subject to the same paleographical reservation as Palmer's ạm.

[7] Or **-ias,** cf. **1.4.f.**

been placed at line-initial position as an expedient, a consideration which would further mitigate this particular objection to Radke's theory of a new section-opening at line 12, as discussed in **1.1.c**.

13.2.d The above remarks may be of interest for the analysis of 13-14 **ha | velod**. Despite the probable line-internal geminate-notations **kapia(d):d-** (line 11) and **ite(r):r-** (line 12), a corresponding ha(u) (= 'haud') | **velod** (thus e.g. Goldmann, Pisani, Lejeune, cf. Prat *Ablatif* 32) may not be a legitimate interpretation, since this would require an unexpected syllable break across lines, comparable to the (diphthong-splitting!) type **Lo | ucina** (CIL 371, cipp. Pisaur.), belonging to one of the "non-standard" systems, to be discussed in the next section.[8]

13.3 *"In Latere" Division*

13.3.a An interesting form of division, not infrequently seen in third- and second-century texts, has at first the appearance of carelessness: the last word of a line is divided in such a way that it concludes not at the beginning of the following line, but by spilling over, as it were, onto the edge of the stone, a technique here referred to as "in latere" division.[9] Calabi Limentani (*Epigrafia* 150) notes the use of this technique, among other "accorgimenti usati per non tagliare la parola finale", noting: "Anomalo quello usato dallo scalpellino dell'elogio di Tuditano (**v. 44** [CIL 652]) di finire la parola sulla facciata laterale della base". But this gives a very misleading impression as to the nature and frequency of this practice. Although a number of isolated attestations can be found, the frequency of its occurrence in the early second-century Lex Spoletina (CIL 366) indicates that this is indeed a "technique" (i.e. a permissible variation), and not a feature to be ascribed solely to chance, carelessness, or error; this

[8] On related problems with "antevocalic *u*-diphthongs" in Latin, see H. Hoenigswald, *Lg.* 25 (1949) 392ff. and A. Hill, *Lg.* 30 (1954) 439ff.

[9] It is convenient to be able to notate this form of division distinctively, for which I here use a double vertical "‖" to signal spill-over onto the edge, vs. the usual single vertical line-break symbol "|", indicating ordinary stichic continuation at the beginning of the next line of text. (The "in latere" notation is adapted from E. Weber, *Epigraphica* 44 [1982] 155.)

form of division occurs no less than eight times in the "original version" of this text:

I.3 **neq ‖ ue**
4 **louc ‖ i**
6 **de ‖ ina**
8 **cau(s) ‖ a**
9 **ced ‖ re**
II.1 **bov ‖ id**
4 **mal ‖ o**
5 **piaclu ‖ m**

It is a striking fact (rarely, if ever, noted) that the preserved portions of the so-called "duplicate" or "second version" of this text (see **12.1.d** above) do not appear to make use of this technique at all, which therefore may constitute one of the more marked paleographical differences between these two forms of the text.

13.3.b Although CIL 366 is certainly the most striking case in which this feature appears more than once on the same stone, it is not isolated; the late third-century cippus CIL 388 (Trasacco) contains examples in both its first and last lines:

1 **Vecos.Supn ‖ a.**
7 **Pac.Anaiedio.St ‖ f.**[10]

and similarly, the Tuditanus elogium in Saturnians referred to by Calabi Limentani (cf. **13.3.a** above), from about 129 B.C. (CIL 652, Aquileia), shows this feature in each of its last three lines:

[10] The line-final puncts (cf. **4.3.e** above, with n. 39), although not recorded in any of the published transcriptions (including Ve 228d, Letta-D'Amato *Epigrafia* 128, Pocc 220, Wachter *Altlat. Inschr.* 186e), seem clearly visible in the photograph (Letta-D'Amato Tav. 45).

4 **Tudita ‖ nus**
5 **Tim ‖ avo**
6 **tradi ‖ t**[11]

13.3.c Likewise, the first two lines of CIL 2661 (171 B.C.; unknown [but definitely non-urban] origin) are both partly written "in latere"; but the reading of this text may be susceptible of some improvement, requiring more extended discussion.

CIL 2661,[12] now lost, is unfortunately known only from a copy (see CIL for details). Despite the hazards of attempting to emend a text transmitted in this fashion, it may yet be worthwhile to suggest some alternative interpretations of the transmitted form of the document. I reproduce below the representation of the copy provided by Mommsen, appearing in CIL p. 739:

The following conventional transcription corresponds in most particulars to the "standard" versions appearing in CIL, Warmington, and Degrassi:

eremo.Pe.f.T.Carpnio.----o.Tit. ‖ Titu[le]no.V
f.macistres.faciedo ‖ corave[ru]
nt.heice.lemena.locata.t.MC.
cos.C.Casio.P.Licnio

[11] The photograph at CIL p. 513 does not show the right edge, but see Degrassi *Imagines* 147.
[12] Pp. 739, 920; Degrassi *ILLRP* 695, Warmington *Remains* p. 144; partial treatment in Wachter *Altlat. Inschr.* §212d.

The name of the first magistrate is universally interpreted as **[P]e(tro)Remo(s)** (most recently Salomies *Vornamen* 86), which has a certain plausibility, to be sure, in view of the following **Pe.f.** But this is troublesome in two respects: first is the fact that word-division, to the extent that we may judge from the transmitted form of the document, is otherwise entirely consistent, including the divisions between nomen and gentilicium in the other two names in the same line; and second, a gentilicium *Remus* is morphologically aberrant and otherwise unattested. The word-division problem could be solved by assuming that the *line-initial* lacuna is larger than a single letter abbreviating the nomen, comprising also at least a word-divider preceding **]eremo**; this (undivided) sequence, in turn, should then be assigned to the gentilicium (ideally a known one) in its entirety: thus provisionally **[-.(-?)]eremo**. Now in evaluating such a sequence, it is evident that an original <NI> (with inclined N) could easily have resulted in (slanted) M at any stage of the production and transmission of this text.[13] A plausible restoration, then, would be **[-.H]ereŋio**, yielding a known gentilicium appropriately spelled, for this period, without gemination (cf. **Casio**, line 4), attested as such, for example, in CIL 176 **P.Herenio** (cipp. Praen.).[14]

As for the patronymic **V | f.** (lines 1-2): if the restoration **[-.H]ereŋio** is correct, and if one makes the probable assumption of vertical alignment for the left margin (except for the final consular formula, which might well have been shifted rightward so as to be centered), one might rather expect **V | [i.]f.** or **V | [ib.]f.** These considerations, together with the apparently empty space after **coɼave**, suggest that the conventional transcription **coɼave[ru] | nt** (CIL, Warmington, Degrassi) should perhaps likewise be adjusted to **coɼave | [ru]nt** (or perhaps rather **coɼave | [ro]nt**). We will have occasion to refer to these last two adjustments in another connection below.

---

[13] Cf. the analogous misreading of Etr. *renine* as *remne* (Rix *Etr. Cog.* 121 n. 56), or Messap. *ŋaratanies* previously read as *ŋaratames* (Haas *Messap. Stud.* 53).

[14] Note that a similar <M> for <NI> analysis [P]e()Reŋio, while appealing to an attested gentilicium (cf. CIL app. 134 C.Reniu), would still be unsatisfactory with respect to the omitted word-divider.

13.3.d In addition to the above-noted multiple instances of "in latere" notation occurring in one and the same text, this feature recurs more than once in some *sets* of texts (these sometimes also with multiple instances in a single text), which again serves to support the idea that this reflects a form of permissible variation, and not an occasional and essentially "anomalous" lapsus. Thus, from the second-century votive set from Veii CIL 2628-2632:

2631 **Victo || rie**
2632.2 **Dea || bus**[15]

and still more strikingly in the (early second-century) *cippi Pisaurenses:*

371 **Iuno(ne).Lo || ucina**
372 **Mat(re).M || atut(a)**
374 **Dei(va).Mari || ca**

including CIL 375, with examples in both lines:

375 **Deiv(eis).[N]o[v] || e.sede(bus)**
T.Popaio.Po || p.f

The feature is also attested in a set of three early official documents found together at Paestum, in which the second — with "in latere" design partly on both left and right sides — is particularly elaborate:

3151.7 **aired.moltatic || od**[16]

---

[15] Actually **DEAI || BVS** (see CIL p. 735, Wachter *Altlat. Inschr.* §202a), with I apparently the beginning stroke of the B, which is then abandoned and continued "in latere".

[16] Mello-Voza *ILP* 140, photo tab. 23. (The photograph at CIL I[2] [fasc. 4] tab. 63 fig. 1 does not show the right edge.)

3152.3 **L Claudio Tr || f**
3152.5 **qaistores || de leged fe || cere**[17]

3153.3 **quaestor || es**[18]

13.3.e This technique is attested with some frequency, then, in a variety of public documents (of both official and "private" character), mainly from the late third and early-to-mid-second centuries, and mainly, it would appear, outside Rome. Indeed, to my knowledge this practice is almost unknown among Roman inscriptions of this period, apart from the following three examples:

CIL 19.2 **[...]one.capt || om** (3rd c.)
CIL 27.2 **Aescolapi || o** (3rd/2nd c.)
CIL 607.4 **dictator[.]voṿ || it** (217 B.C., cf. **3.3.c**)[19]

Later (i.e. first-century) examples seem rare, but certainly occur: e.g. CIL 2131 (Sullan, with apices) a2 **Bar || g[---]**, b2 **sepu || lt** (Degrassi *Imagines* 321).

---

[17] Mello-Voza *ILP* 139, photo tab. 23 (CIL I[2] [fasc. 4] tab. 63 fig. 3). Wachter (*Altlat. Inschr.* §198d, "vidi April 1983") describes the disposition of this line as "Wegen Platzmangels", but does not notate or comment on the "in latere" notation in line 3.

[18] Mello-Voza 141, photo tab. 23 (CIL I[2] [fasc. 4] tab. 63 fig. 4). Wachter (§198f) incorrectly **quaestores**, despite his accurate transcription of 3151.7 (§198e) and description of 3152.5.

[19] The figures **L.I.XXVI**, on the left side of the stone, are generally taken as a stonecutter's note (thus Gordon *Introduction* 6 ad loc., following Degrassi *ILLRP* 118, n. 2 ad loc.). Similarly perhaps *AE* (1982) 80 (*Not. Scav.* 1920, 220 no. 2), line 7 (the last line of the text): **XLVI**; according to *AE*, "La dernière ligne est énigmatique"; but the preceding text (i.e. the text proper) contains precisely forty-six characters. (Compare Mallon's analysis [*Écriture* 303] of the "chiffres tracés à la pointe au bout des lignes" on a late [3rd c. A.D.] Latin inscription from Spain, in which the numerals correspond precisely to the number of letters engraved in each line.)

13.4 *"Overhanging" Patterns*

13.4.a There exists, finally, a kind of notation similar to "in latere" technique, here referred to as "overhanging" notation: a line-final letter for which sufficient space is not available is squeezed in not "in latere", and not at the beginning of the next line, but at the *end* of the next line, or between the end of the line (for which space is lacking) and the end of the following line; thus either

(i) AAA BB
CCC B
DDD

(where AAA, BBB, CCC, and DDD are words), or

(ii) AAA BB
B
CCC DDD

as already attested, for example, in CIL 5 (4th c.), where the **-a** of **Casontonia** actually appears (in much-reduced size) beneath the I of **Casontoni** at the end of line 5 and above the S of **socieque** beginning line 6, i.e. between lines 5 and 6 according to the second pattern described above. It is desirable to have a distinctive transcriptional notation for this "overhanging" layout, for which "/" is here used, thus **Casontoni / a | socieque.**

Another early example appears in CIL 62.1-2 **Pel / t** (type (i) above), and the same inscription uses a variant of type (ii) in the form **merto / d** already noted at **7.6.d** above: here **merto-** ends line 3, while the **-d** is squeezed directly *above* the O, between lines 2 and 3, thus roughly

1 **... PEL**
2 **... DONO T**
D
3 **... MERTO**

13.4.b It can be noted in passing that the general format just described is structurally similar to other patterns in which the overhanging letters curve downward in serpentine fashion, as with the final VE of **Podlouqueique** in the Castor-Pollux dedication (CIL 2833; cf. Gordon *Introduction* 76: "boustrophedon style", despite the stichic continuation of the second line). Given the natural unwillingness to break up the enclitic *-que* and separate it stichically from the preceding term, the engraver has allowed himself a variation in lettering more appropriate to serpentine or boustrophedon contexts (note the right-to-left script direction), despite the stichic continuation, thereby producing a kind of hybrid. Even if the need to resort to this technique was "accidental", the execution itself might well be traditional and acceptable; it corresponds, in other words, to the early "Schriftband-Prinzip" elucidated by Zinn ("Schlangenschrift" 301 with Abb. 3). Wachter may be correct in seeing this exemplar of the Castor-Pollux text as a "reject" (*Altlat. Inschr.* §35b), but the positioning of the VE of *-que* should probably not be included among its alleged defects. It is not difficult, moreover, to find approximately contemporaneous parallels in Archaic Etruscan,[20] as well as in later Italic documents: compare the Faliscan sepulchral tile Ve 270 (= Giac. 67, see Giacomelli's photograph, Tav. 7) **cavipi:leveli | filea** (cf. also **16.4.c** (vi) below on this text), in which both lines read right-to-left (although here the second line, unlike the second line of the Castor-Pollux dedication, is slightly indented), and the last three letters of the first line curve downwards as if to continue in a serpentine fashion, presumably because of lack of space at the left margin. Essentially the same downward-curving notation for the last part of a word is also attested in left-to-right Latin contexts, as in CIL 368 **Apolenei** (Degrassi *Imagines* 7).

13.4.c Perhaps most commonly, the "overhanging" strategy is used for abbreviations, especially **f** (cf. "in latere" usages like CIL 388.7 **Sţ || f**, 3152.3 **Tr || f**):[21] thus CIL 30.1-2 **No / f** (**f** at the end of line 2), 1763.1

[20] E.g. *SE* 50 [1982] 272 no. 16, with facsimile; photo Tav. 40.

[21] Although such patterns do not, strictly speaking, reflect "word-divisions", they nevertheless demonstrate, with respect to the feature under discussion, a kind of "word-

N. / f (here **f** *above* the N, which ends line 1, cf. **merto / d**); similarly 1471.1-2 / **q(uaestores)** (Q at far right between lines 1 and 2). Note also the conventionalized "overhanging" **f** not infrequently found among the *cippi Praenestini* (e.g. CIL 146, 149, 203, 266, 272), and the similar "right-justified" layout also found there, with longer expressions of the sort

CIL 328 **Quorta Tondia**
L.f

2856 **L.Camelio.L.f**
L.n

13.5 *Notes on Critical Applications*

13.5.a From a formal point of view, it should be noted that "in latere" divisions like **piaclu || m** and "overhanging" divisions like **merto / d** are in a sense not "irregular" (or even "divisions") at all: as Dennison has already observed ("Syllabification" 62, cf. Calabi Limentani, **13.3.a** above), such notations constitute only two of a set of available strategies (including the use of ligatures and abbreviations) designed to avoid word-division across actual lines of text, in accordance with the general avoidance of this feature in public documents. The above survey, however, has attempted to provide more detailed characterizations of these particular strategies (vis-à-vis line-end ligatures etc.), in terms of their relatively frequent appearance in early texts (and for "in latere" notation, mainly outside Rome). The characterization of "in latere" notation in particular may allow for certain limited critical applications to problems in texts that show this feature, or that might be expected (in view of their chronological and geographical profiles) to make use of it.

Wachter has already hinted at one such application in his discussion of CIL 388, and his arguments can in my view be strengthened on the basis of the above survey. The text is transcribed in full here for convenience:

---

like" behavior, a point to which we will return briefly at **16.3.g** below in another connection.

Vecos.Supn || a.
Victorie.seinǫ
dono.dedet
lubs.mereto
queistores
Sa.Magio.St.f
Pac.Anaiedio.Sţ || f.

Among the various factors favoring the reading **seinǫ** (cf. CIL 2874 **seino** from approximately the same time and place) over earlier editors' **seinq** at the end of line 2, Wachter observes (*Altlat. Inschr.* §186e) that **seinq** would provide the only other abbreviated (apart from **f** and the praenomina) and specifically endingless form in this text, "denn auf der rechten Seite ist hier keine Fortsetzung zu sehen". Indeed, this is an inscription with two clear instances of "in latere" notation (cf. **13.3.b** above), and the right side provides more than ample space for a continuation **seinq || no** (or even **seinq || nom**). The reading **seinǫ** therefore seems assured.

These facts, in turn, have a more properly linguistic consequence as well, related to the question of "Auslautschwund" in this inscription, a feature of some interest for the documents in Marsian territory (cf., for example, **7.6.d** ad CIL 386/388). According to Wachter (loc. cit.), "Auslautschwund ist mit Sicherheit nur in *mereto* zu beobachten: In *dono* könnte Dativ vorliegen ...; ... die Form *Supn/a* ... ist deswegen höchst erstaunlich, weil hier der Auslautschwund ein *-s* erfasst hat, das aus *-t(i)s* zusammengezogen ist, wogegen im ähnlichen Falle *lubs* (mit Kurzschreibung ...) das *-s* (< **-nts*) geschrieben ist". But if **seinǫ** (NB: not **seinǫ || m**) is correct, this is likely to be accusative, and might thus show Auslautschwund, which is also certainly possible for **dono.**[22] As for **Supn || a** (or perhaps **Supn || a.**, with final punct, cf. n. 10 above) vs. **lubs**: the latter is to some extent a conventional spelling (cf. CIL 62 **lubs**, further 385 **Albsi**, and **14.4.c** below for the syllabic notation), and thus not strictly comparable (even apart from the syllabic notation) to **Supn || a** or **Supn || a.** (NB: not **Supn || as**), which might well show

[22] Cf. e.g. CIL 42 **Poublilia.Turpilia ... hoce.seignum ... Dianai.donum.dedit.**

Auslautschwund. Nor would it be surprising for this feature not to appear in the official term **queistores.**

13.5.b The techniques under discussion have also been alluded to in two other texts treated in previous chapters. CIL 2873b (cf. **5.3.**a, with references in n. 12) is a pyramidal pedestal of the same type as CIL 388, and from approximately the same time (late 3rd c.) and place (near Trasacco). Here note the line-final **Hircol** of line 2 (**T.f.Hircol**), in which the L reaches the extreme right edge of the stone. Letta-D'Amato (*Epigrafia* p. 229, similarly CIL ad loc.) observe: "La desinenza è omessa, anche se teoricamente è possibile che fosse in una terza riga (v. spazio abraso sotto la *t*)". But this is only one of several possibilities, and perhaps the least likely: if the missing desinence is conceived of in the context of the technique of CIL 388 (cf. esp. 388 **Supn ‖ a**), it might therefore be sought rather on the (similarly abraded) adjacent right face; an "overhanging" notation (i.e. under the L of **Hircol**, and not under the line-initial **T**) is also conceivable, in an area that likewise appears to be considerably abraded, to judge from the photograph. Only in the absence of evidence for one of these three possibilities would one need to invoke the relatively unattractive hypothesis of abbreviation.

The consequences of CIL 62 **merto / d** (not **merto**) have already been discussed in connection with Prat's theory concerning the thematic ablative singular (**7.6.d**, cf. also **7.6.c** on CIL 29 **meritǫ** vs. **meritǫ ‖ [d?]**).

13.5.c A final problem worth noting involves CIL 366 (Lex Spolet.) and its "duplicate" CIL 2872, with which this discussion began (cf. **13.3.a** above). Consider first 366 I.8 **cau(s) ‖ a**, often transcribed **cau[s]a**, exactly like **[f]iat** in the following line, as if the (presumably line-final) **-s-** were damaged and no longer legible, but originally inscribed.[23] This does not, however, appear to be the case, as is evident from the photographs and facsimiles, and as explicitly noted at CIL p. 405, where the spelling of I.9 **ced ‖ re** (directly below **cau(s) ‖ a**, at the end

[23] Correctly e.g. Warmington *Remains* p. 154, Palmer *Lat. Lang.* 5 (**cau(s)a** vs. **[f]iat**); incorrectly Ernout *Recueil* 64 **causa** [sic!] vs. **[f]iat**, cf. also Prat *Ablatif* 23 (**cau<s>a, <f>iat**), Degrassi *ILLRP* 505 and Wachter *Altlat. Inschr.* §199c (**cau[s]a, [f]iat**).

of the next line) is similarly described: "I 8 CAV(S)A, 9 CED(E)RE in angulo litterae nunquam conscriptae". Before returning to **ced || re**, note further that the same feature could in theory be claimed for I.6 **de || ina**, with an unusual spelling that has occasioned much discussion. Wachter (*Altlat. Inschr.* §199b) has now shown, on the basis of space considerations, that the duplicate at this point almost certainly read **[devi]ɳa** or **[deivi]ɳa**; thus 366 I.6 **de(v) || ina** would be exactly comparable to I.8 **cau(s) || a** (and perhaps I.9 **ced(e) || re**). Still another example may appear just above, at I.4 **louc || i**: perhaps partly because of the apparent spelling with **-i** (cf. **seiquis, Iovei** etc. vs. **piacli**), as well as the **louci** of CIL 2872, this is ordinarily taken as a genitive (thus explicitly Ernout *Recueil* 64 ad loc. ["génitif possessif"], cf. Warmington's "anything that belongs to the grove" for **quod.louc || i | siet**). Bu it seems equally possible (if not, indeed, preferable) to take this as a locative, in which case we might also have **louc(e) || i**, like **cau(s) || a**, with a missing "littera in angulo nunquam conscripta". If, then, at least the "in latere" form **cau(s) || a** — and possibly as many as two other such forms on the same face — show this quirk of spelling, the status of **ced || re** (directly underneath **cau(s) || a**) becomes open to some question: although the form is now generally taken to reflect either a dialectal syncope or a spelling with syllabic notation (see e.g. Ernout *Recueil* ad loc., and more recently Wachter *Altlat. Inschr.* n. 971), the CIL interpretation **ced(e) || re** seems difficult to exclude, despite 2872 **cedr |** in the "duplicate"; one wonders, indeed, whether 2872 **louci** and **cedr |** owe something to the actual spellings of CIL 366 (or a copy text drawn from it), since the orthographic correspondences between the two versions of the text are otherwise remarkably precise: most of the deviations (apart from 366 **cedito**/2872 **caiditod**) involve final **-d** and **<e>** vs. **<ei>**, for which variation is in any case to be expected for this period.

In contrast to the line-division avoidance strategies implied by "in latere" and "overhanging" notations, it remains to consider actual *stichic* line-divisions, and especially those that violate expected patterns of syllabification.

13.6 *"Anti-Syllabic" Division*

13.6.a Beyond Dennison's findings that "inscriptions antedating the last half of the first century B. C. rarely admit divisions of word by line", except that "carelessly made inscriptions ... show numerous line-divisions, and these often violate the regular rules of syllabification" (cf. **13.1.a**), there is more to be said about the distribution and nature of line-division in early texts.

Even for Roman official (esp. legal) documents, one can distinguish between two different styles of texts with syllabically correct line-divisions, namely (a) those in which word-breaks (with correct syllabic division) appear to constitute an acceptable but sporadically-used option, with a tendency toward usage with enclitics (e.g. CIL 591.4-5 **ustri | naeve** and 5-6 **terra[m] | ve**), or (b) those in which line-divisions are extremely frequent, and seem to reflect a normal component of the overall layout of the text, as in CIL 592: here line-division is found some fourteen times in the first column alone (4-5 **exceptio | nem**, 10-11 **exformu | la**, 11-12 **de | cernito**, 12-13 **dede | rit**, etc.), although a tendency toward usage with enclitics is observable here as well (cf. 13-14 **eo | ve**, 38-9 **sei | ve**, 51-2 **nei | ve**, and the interesting type with abbreviation 28-9 **praefec(tus) | ve**).

Dennison's main interest, as already noted, concerns the treatment of clusters and the evaluation of Roman grammarians' strictures on syllable-division in this regard; certain points can be added to this discussion as well. Thus Dennison chose to ignore enclitics ("Syllabification" 52), including *-que*, although this form class may on occasion be of interest, as when a word-final consonant followed by an enclitic produces a cluster of the type Dennison proposed to investigate.[24] Thus **-que**, when it appears with a line-division, is normally so broken (CIL 756.7-8 **dedicatum | que**, 1471.3-4 **eisdem | q(ue)**, 1236.7-8 **libertabus | que** etc.); but beside 2123.20-1 **postereis | que**,[25] note the interesting division 1273.9-

[24] Cf. Hermann *Silbenbildung* 235: "Schade ist auch, dass Dennison unter den Fällen, wo ein Konsonant zur zweiten Zeile geschrieben wird, *qu* nicht besonders erwähnt".

[25] See also Dennison op. cit. 59 for other attestations of this phrase (so divided) from CIL VI.

10 **posteri | sque,**[26] with the form of division advocated by the granunarians for other sequences of *s* followed by consonant. In some other cases, pertinent data can be added: thus, among *muta cum liquida* sequences, Dennison records no examples of the cluster *-dr-*, but note e.g. CIL 2137.6-7 **qua | dratus.**[27]

It is rather the divisions that violate norms of syllabification (whether the grammarians' or those uncovered by Dennison) that are of most interest here, since (apart from the general imputation of carelessness) these "violations" are largely ignored by Dennison and most other authorities. The remaining discussion, then, will be largely concerned with such "anti-syllabic" divisions, mainly open syllables with divisions *-VC / V-* or *-CV / C*, and certain cluster types not treated by Dennison, of the type **Po | mponia** (CIL 3197).

13.6.b Early Roman examples of word-break across line (whether in violation of expected syllabification or not) are indeed rare to the point of nonexistence, but not difficult to find elsewhere, even in formal dedications, as in the following late third- and early-to-mid-second-century examples:

(i) CIL 1531 (Vertuleiorum dedicatio, near Sora) 6-7 **lube | tes** (cf. much later 1792 **liben | tes**);

(ii) 1926 (Cingulum) 1-2 **magister | ę**, 3-4 **Vibolen | us** (cf. **4.7** above), in a three-line text: thus with breaks — indeed, anti-syllabic ones — in both possible positions;

---

[26] In a document with three other breaks, all regular: 5-6 **Quar | tus**, 7-8 **fece | run**[t], 11-12 **Quin | tilis.**

[27] On problems with *muta cum liquida* divisions, see Hermann op. cit. 235, and further 213 for the division in *quadrāgintā* and the problem of the treatment of original **-tur̥-*. On the latter, see now also R. Coleman, in *IE Numerals* 400 with n. 39. The phonological explanation favored by Coleman ("simplification of the emergent consonant-cluster in *-twrā* through the loss of [w] and the transfer of its resonance to the preceding stop", i.e. *-tur̥ā-* > *-drā-* directly) is not only, as he readily admits, "very ad hoc", but encounters problems with the failure of this *-drā-* to undergo the *-dr-* > *-tr-* rule (cf. **14.4.g**), which would have restored the *-t-* and thereby, one assumes, rendered the resulting form (**quatrātus* or the like) relatively stable in view of *quattuor*. For a more promising approach to the problem, see now Schrijver *Laryngeals* 492.

(iii) 2661 (unknown [but non-urban] origin, cf. **13.3.c** above) 2-3 || **coɼave[ru] | nt** or **coɼave | [ru]nt**, and perhaps 1-2 **V | [i.]f** or **V | [ib.]f** (see the discussion of these divisions in **13.3.c**);

(iv) 24 (unknown [but possibly non-urban] origin) 1-2 **Ve[l] | iterns**, 2-3 **lo[c] | avit**, 3-4 **eisde | m**, in a four-line text: thus with (anti-syllabic) breaks in all three possible positions (cf. (ii) above).[28]

The appearance of multiple examples of line-division in individual inscriptions is noteworthy, as is the prevalence of anti-syllabic breaks. Such patterns become progressively more common in second- and first-century texts, where anti-syllabic division continues to be attested largely in non-urban locales, as shown by the following survey of additional examples from CIL I[2]:

(v) 654 (Venafrum) 1-2 **Corneliu | s**
(vi) 680 (near Capua) 3-4 **grad | u**
(vii) 1251 (Rome) 4-5 **aedific | avi**
(viii) 1436 (Nemus Dianae) 1-2 **Arbuxse | ius** (cf. e.g. Degrassi *ILLRP* 826.6-7 **Pompei | us**)
(ix) 1591 (Capua) 2-3 **Metroph | anis**, 5-6 **leibe | rtei**
(x) 1798 (Superaequum) 3-4 **fue[r] | at** (cf. Degrassi *ILLRP* 826.7-8 **fue | runt**)
(xi) 2270 (Carthago nova) 1-2 **m | agistris**
(xii) 2371 (ager Mantuanus) 1-2-3 **Ant | ioc | us** (cf. 3-4 **fi(n) | xi**)
(xiii) 2538 (Fundi) 1-2 **Dion | isius**
(xiv) 2970 (Cos) 5-6 **benevol | [entiae]**
(xv) Degrassi *ILLRP* 203 (near Verona) 1-2 [---] | s, 5-6 **L | entulo**
(xvi) 3034 (Ostia) 5-6 **Straton | ice**

[28] CIL (p. 861) claims urban origin, without cogent argumentation (understanding (*pro*) **Velitern(i)s**); but the word-division patterns certainly do not favor such an attribution. Note also that the inclined N of what appears to be **Ve[l]iterns** could in principle be interpreted as an early ligature N+V (cf. **12.1.c** above on CIL 2391 **Numisio** or **N(u)misio**), hence yielding **Ve[l]iternus** directly, in the phrase **aid.cur. Ve[l]iternus**.

(xvii) 3197 (origin unknown) 1-2 **Po | mponia**
(xviii) 3356b (Viterbo) 1-2 **bon | um**, 2-3 **ha | nc**
(xix) 3400 (Valperga) 2-3 **Severin | a**
(xx) 3401 (ibid.) 1-2 **Corenel | ia**
(xxi) 3403a (Vercelli) 4-5 **Argantocomater | ecus**, 6-7 **hominịḅ | us**
(xxii) 3464b (Adamúz [Córdoba]) 1-2 **Ter | entius**[29]
(xxiii) 3561 (ager Mantuanus) 1-2(-3) **Se | rto | rius**

(Various uncertain or problematic cases are omitted, as with the **dono | m** of one of the possible restorations of CIL 2867, cf. **7.6.f** (iii) above.)

13.6.c Despite Dennison and others, the partly systematic nature of these attestations (not to mention their geographical distribution) does not strike me as attributable solely to carelessness or chance. It is noteworthy, to begin with, that more than half of the above examples involve proper names, and several others involve titles (**magistris/ṃagisterę, leibertei**, cf. also **hominịḅus**, and the "formal" pronoun **eisdem**). Of the eight remaining forms, fully four can be conceived of as reflecting "etymological" divisions, namely

grad | u
aedific | avi
bon | um
lo[c] | avit

and it is possible that some of the names can be so analyzed as well, thus

Severin | a
Corenel | ia
Argantocomater | ecus

and perhaps also **Metroph | anis.**

---

[29] For the examples from Spain, note also **Dis Manib | us** and **Ca | ecili**, on a recently-published (early Imperial) epitaph from Toledo (G. Alföldy, *ZPE* 86 [1991] 117ff.).

There is, however, another more persistent feature that is found in nearly all of the non-etymological forms (as well as in three of the names just listed), namely the presence of liquid or nasal at the word-division, as in the following "open-syllable" examples:

r **fue[r] | at**
Argantocomater | ecus
Ter | entius
m̨agister | e̦

l **Ve[l] | iternus**
benevol | [entiae]
L | entulo
Corenel | ia

m **m | agistris**
eisde | m

n **Dion | isius**
Straton | ice
Severin | a
Vibolen | us

cf. also **bon | um**, listed in the "etymological" set above. Much the same distribution appears in the relatively rare "cluster" examples, all of which have the form *-V | rt-* or *-V | m/nC-*:

leibe | rtei
Se | rto (| rius)
Po | mponia
ha | nc

and perhaps also **co̦rave[ru] | nt**, according to the traditional restoration. The overall rarity of this type may not be accidental: thus for CIL 2970.5-6 **benevol | [entiae]** (**13.6.b** (xiv) above), the rather odd extended horizontal of the L, as well as the extra space at line-end (see Degrassi

Imagines 172), suggest a deliberate avoidance of **benevole | [nt-]** in favor of **benevol | [ent-]**; something like this may also be a factor in the early **lube | tes** (CIL 1531, **13.6.b** (i) above), vs. **lube | ntes**, even if the spelling reflects phonetic nasalization (/lubēt-/).

13.6.d The non-urban profile of the various patterns discussed above invites comparison with non-Latin orthographies, where abundant comparative material is in fact to be found; a proper contrastive treatment, then, is beyond the scope of the present work. It seems appropriate, however, to signal certain salient features pertaining to word-division, especially in Oscan and Umbrian, beginning with the latter.

In the Iguvine Tables (see in general Kent *Criticism* 27ff.), the coincidence of line-end and word-end is absolute in the portions notated in Latin alphabet, in accordance with the strictest form of Roman official practice. The technique in the native-alphabet portion, however, is considerably different. While line-end and word-end generally coincide,[30] there are some eighteen instances of word-division across lines. In general, it can be said that most of these cases can be explained on the basis of space considerations, which thus "override", under certain circumstances, the normal constraint on line-end/word-end coincidence. The clearest example occurs on tablet Ia: whereas word-end and line-end coincide in lines 1-25, the concluding nine lines of text (26-34) contain no less than five word-breaks.[31] The need to compress the final section of text (beginning in line 24) onto the bottom quarter of the tablet necessitated the use of all available space, and hence the frequent word-breaks. Most of the other examples can be accounted for as a result of a somewhat different form of space consideration, related to the frequent use of section-indicating space punctuation, especially in a series of relatively short sections: if a line ends with a relatively long word that cannot quite fit in the remainder of the line, it is better to fit in most of the word and then break it, rather than beginning the word on the next line, since this would leave excess space at line-end, which might confusingly signal the beginning or end of a section

[30] Sometimes at the expense of curving the last few letters of a line obliquely against the margin, see Prosdocimi *Tavole* Tav. 33, and Va 20, 22 ad loc.

[31] **26-7 pesnim | u**, 28-9 **ukri | per**, 29-30 **feit | u**, 30-1 **staf | li**, 31-2 **ikuvin{ą} | a** (for **ikuvin | a**; see Prosdocimi *Tavole* ad loc.).

where no such sense break actually existed: hence Ib 10-11 **pernaia | f**, 20-1 **amprefu | us**, IIa 24-5 **ahtrepuřa | tu**, Va 15-16 **kumnah | kle**, Vb 5-6 **pepurkure | nt**, etc. The examples so far adduced, moreover, show that there are no operative constraints related to syllable structure: once the choice is made to break a word (to the extent that such choices are made ahead of time by the stone-cutter), the word is simply continued to the end of the line and then broken, leading inevitably to a relatively high percentage of "anti-syllabic" divisions.[32] Thus native Umbrian orthographic practice incorporates a form of space-constrained license with respect to word-division that allows for a certain percentage of random word breaks at line-end, a point not without potential interest for the relative frequency of "anti-syllabic" division in non-urban Latin texts.

In Oscan, the longer official texts show techniques that correspond to Roman "standard" practice, i.e. consistent avoidance of word breaks at line-end (as in the Agnone Tablet, Ve 147), or allowance of word-division, which can even be relatively frequent (cf. **13.6.a** above), but which generally follows the same constraints on syllable structure typical of Latin (with rare exceptions): thus the Cippus Abellanus (Ve 1) has no less than eleven word breaks, all of which conform to Latin usage except 6-7 **amfr | etpert** (cf. 19-20 **am | fret**); the Tabula Bantina (Ve 2) has three "normal" word breaks; among Pompeiian building-inscriptions, Ve 8 (an eleven-line text) contains seven word breaks, all of the Latin type except 5-6 **ter | emnattens**; similarly Ve 11 with three breaks, of which two are "standard" vs. 4-5 **púmp | aiians** (cf. Ve 85.5-6 **púm | periais**), etc. There is, however, an interesting feature of Oscan technique that does not correspond with standard urban usage. Many isolated instances of "anti-syllabic" division can be found, to be sure, in all varieties of Oscan (esp. So. Oscan), as well as in some of the Central Italic dialects, and in Faliscan; but the most remarkable concentration of such forms appears in the *iúvila*-inscriptions, where word breaks across line-end are abundantly attested: thus Ve 83B (2x), 81 (3x), 84 (5x), 86 (6x), 85 (7x). Indeed, of the seven word breaks in Ve 85, five are of the "anti-syllabic" type:

---

[32] For the "random" nature of these breaks, cf. Ia 26-7 **pesnim | u** and IIb 20-1 **pesni | mu**.

2-3 **iní | m**
6-7 **pr | ąi**
7-8 **mamerttia | is**
8-9 **sakrasia | s**
10-11 **fuf | ens**

and numerous other forms of this type are easily found in these texts. The reason is not far to seek, and is similar to the rationale behind the Umbrian cases, as described above: the design of a number of these documents is strictly rectangular (including an incised rectangular "frame"), resulting in lines of almost identical length;[33] this "full justification" format, then, entails much the same random word-break technique found at the end of Tab. Ig. Ia, as described above. Thus Oscan, too, has an archaic (and clearly "formal", however one interprets the precise function of these documents) format type that not only allows for, but guarantees, the regular occurrence of word-division at line-end, including frequent "anti-syllabic" divisions.

[33] See the photographs in Franchi de Bellis *Iovile* of her inscriptions 17A, 20-23, as well as her measurements of line lengths for the inscriptions in question.

CHAPTER FOURTEEN

Syllabic Notation

14.1 *Introductory: Chronology, Distribution, and Nature of the Data*
14.2 *Constraints on Vowel Quality and Position in the Word*
14.3 *Syllabic Notation in Initial Syllables*
14.4 *Syllabic Notation in Second Syllables*
14.5 *Final Remarks*

14.1 *Introductory: Chronology, Distribution, and Nature of the Data*

14.1.a Among the better-known orthographic features generally associated with Praenestine Latin (although found elsewhere as well) is the practice of "syllabic notation", as in forms like CIL 1445 **Dcumius** (i.e. **D(e)cumius**).[1] There are, however, a number of uncertainties surrounding this form of notation, among the most prominent of which is the following: "Wieweit das auf stark reduzierte Aussprache oder völligen Schwund hinweist, ist unsicher" (Sommer-Pfister); compare Wachter's recent discussion (§21c), in similar terms, of the problem of distinguishing between syllabic notation and actual syncope. Also unclear is the extent to which syllables with /a/ can be notated in this way: largely on the basis of Roman grammatical evidence (VII.14.15ff. K [Ter. Scaur.] on *dcimus* = *decimus*, *krus* = *cārus* etc., see Sommer-Pfister *Hdbch.* 31, Peruzzi op. cit. 147ff.), the use of **k** with the value **k(a)** is generally admitted, while the interpretation of forms like CIL 191 **Mgolnia** as **M(a)golnia** is controversial. Finally, although the practice is in general assumed to derive from Etruscan influence, the details of its transmission are obscure, partly

---

[1] Cf. Sommer-Pfister *Hdbch.* 111, with earlier references, esp. Ernout "Parler" 307ff., whence most subsequent handbook discussions (typically e.g. Palmer *Lat. Lang.* 61); more recently also Peruzzi *Mycenaeans* 144, 147ff. (in a discussion of Etruscan and Venetic syllabic punctuation), Wachter *Altlat. Inschr.* §21, and G. Bonfante, *AGI* 73 (1988) 54. For theoretical discussion in terms of the nature of syllabaries, see P. Daniels, *JAOS* 110 (1990) 727ff. and *Lg.* 67 (1991) 840; for syllabic notation ("abbreviated writing") in (alphabetic) Greek inscriptions, see Wachter, *Kadmos* 30 (1991) 49ff.

owing to uncertainties about this usage in Etruscan itself. As with some of the other problems discussed above, it appears necessary to content ourselves, more or less, with arriving at a somewhat clearer characterization of the extent of our ignorance. It may be possible, nonetheless, to attain some further precision with regard to the first two problems (the relationship with syncope, and questions related to vowel quality); these, in turn, may be of potential interest for the problem of the relationship with Etruscan spelling, which cannot be pursued in detail here.[2] Before proceeding with discussion of these problems, there are several more general points to be addressed concerning the chronology, geographical distribution, and linguistic nature of the attested forms showing syllabic notation.

14.1.b The conventional statement that syllabic notation in Latin is not attested before the third century (e.g. Wachter §21c) is subject to some qualification, as is its traditional association with Praeneste.[3] Ernout ("Parler" 311ff.) had already subjected the forms then thought to show this notation to a geographical analysis, and concluded (315) that this was a practice "dont on retrouve des traces dans la plupart des dialectes italiques depuis le territoire méridional de l'osque jusqu'au nord de l'Ombrie et du Picenum". The removal of some of his uncertain or incorrectly analyzed examples does not invalidate this general point, and several new examples tend to support it: thus note CIL 2908 **Crere** (Veii, early 3rd c.), 3491 **Mẹnrva** (Tarraco, 218-200 B.C.), 2873d **Crvị[** (Trasacco, late 3rd c.).[4] As for South Picene, the status of the suggestive forms *pdufem, kduíú,* both in the same text (CH 1), as well as *qdufeniúí* (TE 7), is not entirely clear, despite the probable underlying **ped-* and **ked-:* in CH 1, note, for example, *iokipedu* directly preceding *pdufem,* and *iepeten* in the same text, the latter a relatively frequent word, with *-pe-* and *-te-* invariably spelled out elsewhere (MC 1, MC 2, RI 1, TE 2). Thus Marinetti (*Iscrizioni* 112 n.

---

[2] I am extremely grateful to Rex Wallace for his generous assistance in analyzing the Etruscan data.

[3] Cf. Bonfante (loc. cit.), who mistakenly claims this notation to be attested, for Latin, only in Praeneste.

[4] For *k(a),* note also Ven. *Katulstos* (*Veneti* Es 126), in support of the interpretation *K(a)tulistoi* (*LV* Es 104, *MLV* 102); see A. Marinetti, *SE* 51 (1983) 288 and Prosdocimi *Veneti* 258f.

74, cf. also 138 on *qdufeniúí*) may be correct in taking *pdufem* and *kduíú* to reflect actual syncopes (rather than instances of syllabic notation), or perhaps (as Marinetti notes, in view of the absence of assimilation in *pd-* and *kd-*) spellings for "ultra-short" reduced vowels. Nevertheless, the widespread use of this practice already by the late third century suggests that the absence of syllabic notation in the meager body of Latin texts earlier than the third century may be partly, in a sense, "accidental": whatever the ultimate source of this practice was, its strictly Latin usage may well reflect a certain amount of development and innovation by the time it is attested. It is thus not quite legitimate to expect to find a perfect correspondence either between Etruscan and Latin usage, or between Latin letter names[5] and Latin usage, according to the standard conception of the nature of syllabic notation.[6]

14.1.c A fact of some interest for the origin and development of syllabic notation seems not to have been noted before, namely the preponderance of onomastic forms in the material from Praeneste (twenty of the twenty-three Praenestine cases listed by Ernout "Parler" 309) and elsewhere (cf. the Oscan-Latin onomastic correspondences discussed above in Ch. **11**, in the context of "geminatio vocalium", as well as the dialectal notations of palatalization discussed in Ch. **12**).

Moreover, certain names make use of this feature with some regularity; thus for Praeneste, note especially **Orcv-** for *Orcevius/Orcivius* (cf. Ve 448): CIL 228 **Orcvio**, 229 **Orcvio**, 231 **Orcvius**, 2467 **Orcvia**, and similarly (for *Gemin(i)a*) 131 **Gemna**, 170 **Gminia**. The same feature appears even more broadly distributed for *Petronius:* thus, in addition to CIL 239/240 **Ptronio** (cipp. Praen.), also CIL 2070 **Ptroni** (Etruria), Ve 215q *Ptruna* (Paelignian, cf. **12.3.b**), Ve 234 *ptrnio* (Umbrian),[7] and in an

---

[5] See in general Gordon *Letter Names* (with only incidental notice of syllabic notation, 15 n. 26).

[6] E.g. Leumann *LLuF* 12; see now the extended discussion by Wachter (§§2lb-c; similarly for Greek notations based on letter names, in the article cited above, n. 1), who nevertheless fails to consider one of Gordon's principal findings concerning the Latin letter names, more on which below [**14.5.a**]). A final observation concerning the chronology of syllabic notation will be reserved for section **14.5.c** below.

[7] On the "double" syllabic notation in this form see Wachter *Altlat. Inschr.* n. 119, and further *Pscni*, **14.3.b** below; for <ptr> cf. also Praen. **Diesptr** (CIL 564), discussed further in **14.2.d** below.

Etruscan context, CIE 3453 *ptroni*, CIE 789 *ptronia* (both from Clusium, in Latin alphabet). The conservative orthographic traditions reflected in **Orcv-**, **Ptron-** etc. provide a further indication of the relative antiquity of this feature, to which one may compare ungeminated traditional "family" spellings of the type **Flacus**, **Tulius** etc., which persist long after geminated orthography has become the norm in other lexical items.

14.2 *Constraints on Vowel Quality and Position in the Word*

14.2.a Wachter's discussion of the relationship between letter names (*"be, ce, de"* etc., according to his versions) and syllabic notation includes mention of a letter name *"ka"* (cf. *Altlat. Inschr.* §21c); but his subsequent concern with the problem of distinguishing between syllabic notation and forms with syncope (echoing one of the major concerns of Ernout's presentation) mentions only forms with non-notated (or syncopated) *ē/ĕ* or *i*. Similarly, Ernout's general description and analysis of syllabic notation (see esp. "Parler" 313ff.) refers only to *ē/ĕ* and *i*, and Bonfante (loc. cit., with explicit comparison to Etruscan) concerns himself only with *ĕ* and *ĭ*. Although Ernout had listed several cases of syllabic notation not involving *ē/ĕ/i*, Radke (*Arch. Lat.* 91 with nn. 93, 94 (p. 206)) has recently taken the strong view that such forms are actually excluded: "Die Buchstaben *b, c, d, p* können gelegentlich auch in der Bedeutung *be, ce, de, pe* stehen, *k* für *ka* ... . Bei *M(a)golnia* und *T(a)lanios* verhindert das *a* der ersten vortonigen Silbe jedoch eine derartige Erklärung" (n. 94).

Radke's *T(a)lanios* (i.e. CIL 322 **Tlanio** [cipp. Praen.]) is simply spurious, since the form is no doubt to be read *T(i)lanio*, cf. CIL 315/316 **Tilanio** (cipp. Praen.), and further **14.3.b**, **14.4.g** below. But CIL 191 **Mgolnia** (cipp. Praen.) was indeed the sole Latin example of syllabic notation with *a* recorded by Ernout ("Parler" 309). This is, however, a well-established Praenestine name: "... sehr traditionell in Praeneste müssen ferner die Geschlechter der Dindii und Magulnii sein, denn die zwar in Rom hergestellte, jedoch in Praeneste gefundene und deshalb mit Sicherheit für eine (noble!) Pränestinerin bestimmte Cista Ficoroni ... bezeugt uns diese beiden Geschlechter bereits für das Praeneste des ausgehenden 4. Jh." (Wachter *Altlat. Inschr.* §80b). In principle, it would not be surprising to

find a traditional spelling of this sort for such a name, matching formally the type (Praen.) **Ptronio, Dcumius**. Moreover, Radke's alternative assumption of syncope is phonetically implausible for such a cluster, precisely as in **Ptronio** and **Dcumius** (cf. Wachter §21c on this point, with respect to the last two). Although there is virtually no evidence for syllabic notation with *a* elsewhere in Latin, Praen. **Mgolnia** is difficult to explain away, and should probably be taken as a genuine case.[8] Even if similar examples are lacking from Etruscan,[9] there is no reason to doubt that this technique could at some stage also be applied, in its Latin incarnation, to such situations.

Rather less attractive than **Mgolnia**, as an instance of syllabic notation with *a* as such, is Ernout's alleged Oscan example "MRNV" ("Parler" 311), which he interprets as "*Marnu* gén. de *Maras*" (perhaps following Conway *Dialects* 56: "apparently a complete word"). Such a genitive formation for this (rather common) name is otherwise unattested (see Lejeune's detailed study of the inflection of this name, *RPh* 49 [1975] 181ff.); cf. rather Vetter's transcription **mṛ nú** (22c), "wohl *m(a)r(as) nú(viis)* aufzulösen", with plausible recourse to the frequent abbreviation **mr** (thus also Lejeune, *Anthrop. osque* 13). Nevertheless, this abbreviation may itself provide some support for syllabic notation with *a:* note that this form appears to be the more traditional version (**mr** 14x Ve, 5x Pocc, cf. Pael. *mar* Ve 215e),[10] beside **ma**/*ma* (2x Pocc) and **mh** (2x Ve, 1x Pocc).

14.2.b Like **Mgolnia**, Ernout's Latin example **Rtela** (CIL 1193, olla ex vin. S. Caes.) = *R(u)tela* ("Parler" 312, citing Etrusc. *rtania* and *rutania*, cf. Rix *Cognomen* 240, 242) appears to be a genuine example with *u*, again in the first (unstressed) syllable of a name, attested in material which shows a certain inclination for this traditional orthography (cf.

---

[8] The other possible candidates known to me are better interpreted otherwise: thus CIL 504 **vilic** = *vilic(a)*, on an Esquiline lamp, is more likely an abbreviation (cf. also **14.2.d** below, and further **16.3.e** on the punctuation in **vilic.nostra**); CIL 3238 **Herclit** (= Ve 215k) is Paelignian, and simply shows syncope (cf. Jiménez Zamudio *Peligno* pp. 69, 89).

[9] Somewhat differently *n* for *(a)n* in CIE 5119 *hescnas*, according to Pfiffig (*Etr. Spr.* 59), although the "full form" *hescanas* is itself more likely to result from anaptyxis (R. Wallace, per litt.).

[10] For additional examples of **mr** see now *SE* 53 (1985) 248 (no. 24), 275ff.

Ernout loc. cit.). (Again, the assumption of syncope would be highly implausible on phonetic grounds.)

We can now return to the interpretation of the ligatured spelling of *Numisio* in the archaic dish inscription CIL 2391, of unknown origin (cf. **12.1.c** above): in view of the existence of **R(u)tela** and the likelihood of similar traditional spellings with syllabically-notated *u*, not to mention the improbability of a triple ligature for this period (although the letter sequence allows for this technical possibility), it seems preferable to interpret the form as **N(u)misio**, with double ligature N+M and syllabic notation of *N(u)-* (again, in an initial unstressed syllable of a name), comparable to **R(u)tela**.

As for the sequence *q(u)*, Wachter observes (*Altlat. Inschr.* §21d): "kommt hier m.W. die Möglichkeit, vokalisches *u* in der Schrift zu unterdrücken (z.B. **peqnia, *qravere* o.ä) nirgends vor". While this is apparently true for the earlier period, there is at least one later example known to me, namely **Vereqda** 'Verecunda' (*AE* [1986] 427, line 3; S. Pablo de los Montes, Hispan. cit.), cf. **quravit** in the same text (line 9), and further **arq** 'arc(uarius)' or even 'arc(u)(arius)' (line 7), perhaps with a second instance.

The complete absence of cases with non-notated *o*, finally, is presumably not unrelated to the absence of this vowel in Etruscan.[11] Moreover, even though Latin *o*-forms might seem to constitute an extension of the system as natural as *a*-forms or *u*-forms, the absence of ****C(o)minius** and the like suggests that **M(a)golnia** and **R(u)tela** reflect relatively archaic (if innovatory) expansions of a system originally restricted to front vowels (with the possible exception of *c(a)/k(a)*).

14.2.c In terms of vowel quality, it remains to consider, apart from the rare instances of *a* and *u*, the exact nature of the front vowels that form the bulk of the attestations of syllabic notation.

As noted already by Ernout ("Parler" 310, 313, cf. Wachter §21c with n. 123), a non-notated *"e"* can be long or short, including compensatorily-lengthened *ē* from sequences *-ens(-):* in addition to

[11] The interpretation of CIL 2712 (= TLE 347) **Statnes** is unclear, as noted by Wachter (n. 996); Degrassi (*ILLRP* 1119, cf. *Imagines* 359) suggests *Stat(o)nes(es),* but even if the reading is correct, the compressed format (on a *glans*) renders abbreviation likely.

Dcumius etc. with *ĕ*, also CIL 560 (Praen.) **misc** = *misc(ē)* (see further **14.4.c** below on this form), 385 **Albsi** = *Alb(ē)(n)sɪ*, among other forms. Moreover, Wachter's analysis of *"Orcīvius"* (*Altlat. Inschr.* §84b) makes it tolerably certain that spellings like **Orcvio** (cf. **14.1.c** above) reflect (or at least originally reflected) a monophthongized **Orc(ę̄)vio** (attested as such in the archaic Praenestine dedication CIL 60 **Orcevia**) < **Orceivios*, and forms like CIL 90 **Atlia** (cipp. Praen., cf. 1212 **Ateilius**, 3017 **Ateiḷi[a]**) should probably be interpreted the same way (cf. Wachter §21c with n. 121, and further §80c with n. 521, adding CIL 197 **Matlia** (cipp. Praen.)). Thus syllabic notation can spell *"ī"* only in this restricted sense (i.e. old closed *ę̄* resulting from monophthongization, in non-urban contexts, of **ei*); to my knowledge, there are no cases in which a non-notated *"ī"* reflects an old **ɪ*. It is at least possible, however, that for *i*-vowels, the system may originally have been restricted to short *ĭ*, and it is precisely the ambiguities between *ĭ*, *ĕ* and syncope (cf. CIL 62 **mertod** = *mer(e)tod* ? *mer(i)tod* ? *mertod* ?) that define the most serious form of the problem raised at the outset of this discussion. If it could further be shown that the distribution even of *ĭ* was somewhat restricted, the problem might appear in a different light. I return to this point below, after considering syllabic notation from the point of view of its occurrences in various positions within the word.

14.2.d It does not seem to have been noted that clear instances of syllabic notation beyond the second syllable of a word are exceedingly rare. Thus, Ernout ("Parler" 310) explicitly cites Praen. **Diesptr** (CIL 564) as an example with omitted vowel in a third syllable. While such a form may well indicate that usage in this regard — at least in the early period — was perhaps not quite rigid, this is not a strong counterexample: there is a clear compound boundary before **-ptr**, which is comparable (as Ernout already saw) to the self-standing **patr** in CIL 216 (cipp. Praen.; see further **14.4.d** below on this and similar two-syllable forms).[12] Note also

[12] For **-ptr**, cf. also the identical sequence **Ptr-** in the "traditional" onomastic spelling noted in **14.1.c** above. Note, incidentally, that **Diesptr** could in principle reflect a traditional orthography designed to render either a pre-vowel-weakening **Diesp(a)tr** (cf. **M(a)golnia**), or a restored spelling of that sort, cf. CIL 568 (Praen., 3rd c.) **[-]iespater**, 454 **]spater** (Falerii, early 4th c.; **3.3.d** n. 69).

that Ernout's third-syllable example Osc. **prúfattd** (Ve 13) = **prúfatted** ("Parler" 311) is also suspect: the form is line-final (indeed, inscription-final), and according to Vetter (ad loc.), "Das *e* ist aus Raummangel ausgelassen", and the same objection applies to **prúfts** (Ve 83, "eine durch Raumnot erzwungene ungewöhnliche Innenkürzung"). Thus in general, a third-syllable (and absolute-final) case like 504 **vilic(a)** is suspicious in this respect, which serves to support the interpretation of such a form as an abbreviation (cf. n. 8 above). Similarly, 2873b **Hircol** (cf. **5.3**) is either an abbreviation, or had a concluding **-e**, now no longer legible, in one of three possible locations on the stone, as already discussed (**13.5.b**). The infinitives CIL 478 **caper**, 501 **tanger** may be actual *-e*-less forms (cf. archaic/popular *biber* = *bibere*), whether via phonetic apocope, or by analogy with forms like *fer*, Cat. 27.2 *inger*, etc. (Leumann *LLuF* 92f.).[13]

In view of this possible restriction to the first two syllables, we have all the more reason to take the vowel-omission in forms like CIL 390/391 **Valetudne** (Castelluccio di Lecce, i.e. Marsian territory) as resulting from syncope, which is suggested in any case by the phonetic environment (ripe for syncope), as Wachter has observed (*Altlat. Inschr.* §110h; similarly Praenestine forms like CIL 558 **Prosepnai**, 554 **Melerpanta**). In the same way, Mars.-Lat. **Aprufclano** (CIL 5) is not likely to show syllabic notation, despite Ernout ("Parler" 311),[14] and syncope remains possible (if not probable) for CIL 37 **vicesma**,[15] unless this is simply an error (cf. Ernout *Recueil* 26: "faute du graveur").[16] Syncope is again preferable to

---

[13] As pointed out to me by Rex Wallace, the Etruscan examples of syllabic notation collected by Pfiffig (*Etr. Spr.* 58ff.), most of which are undifferentiated as to chronology, somewhat indiscriminately include a number of forms that may better be explained on the basis of (neo-Etruscan) syncope (esp. in medial syllables). It seems clear, nonetheless, that the Etruscan examples are primarily attested in the first two syllables of words. Although forms with (third- or fourth-syllable) *-r(e)* can be found in Pfiffig's material (*melacr(e)* < Μελέαγρος, *hamfiar(e)* < Ἀμφιάραος; NB: both on mirrors, where space considerations may be involved), Lat. **caper**, **tanger** are not likely to have anything to do with such items.

[14] Cf. *Fiduclanius, Fidiclanius,* including the new attestations of **Fiduclanius** (bis), **Fiduclania** in *Epigraphica* 48 (1986) 18ff. (19 n. 2 for previously known attestations).

[15] Thus explicitly Coleman, in *IE Numerals* 414.

[16] According to Ernout's detailed explanation ("Parler" 311 n. 2), the cutter might have confused the I of (expected) **VICESIMA** with the first stroke of the immediately following M, thereby omitting the I. But a glance at the photograph (see Degrassi *Imagines* 27, or Ritschl's apograph, *Prisc. Lat.* 2B) shows that this is implausible, since this inscription uses a starkly vertical I, but slanted M, not upright M. Nevertheless, the letter

syllabic notation for the third syllable of CIL 2542 **couravru** (cf. **14.4.g** below with n. 39), and several other forms are simply too uncertain to be used as evidence one way or the other.[17]

To the extent that this descriptive observation reflects an actual constraint against the use of syllabic notation beyond the second syllable, such a restriction (or tendency) may belong to a secondary development of the system, since, apart from the possible existence of a few such forms in Etruscan, as already noted, there may be one or more bona fide third-syllable examples in Latin texts. It may be significant, however, that like **Diesptr**, the other possible example known to me occurs in a third-century text, i.e. among the earliest-attested examples of syllabic notation. In the archaic bronze plaque from Lacus Fucinus CIL 2874, the puzzling form generally transcribed **edndre** or **edṇdre**[18] is probably to be read **edędre** = *ēded(ē)re* with syllabic notation, as Wachter tentatively suggests (§190 ad fin.); cf. the syllabic notation of the immediately following word **cosn[** = *co(n)s(e)n[*.[19] Somewhat as with **Diesptr**, one could claim, in any case, that the morpheme boundary after the prefix *ē-* serves to weaken the value of such a form as a counterexample to the tendency against syllabic notation beyond the second syllable. Indeed, the unpublished inscription from Trevi cited by Prosdocimi and Marinetti (op. cit. 110f.) provides precisely the simplex form **dedre** (which Prosdocimi and Marinetti again

---

spacing of the third line (**aidiles.vicesma.parti**, with twenty characters, including interpuncts; cf. seventeen in line 2 **P.Condetios.Va.fi**) is markedly cramped, especially following **aidiles**, which may well be a factor in interpreting the absence of *-i-* in **vicesma**, whether this is an actual error, or perhaps rather a license based on a synchronically acceptable syncopated pronunciation.

[17] E.g. CIL 2439 **palostca** (Praen.), sometimes taken as *Palost(i)ca(-);* but see Wachter *Altlat. Inschr.* §94a for the intractable paleographic problem here. (Palmer's **Palost(ri) Ca | [prot(inae)** [*RRRE* 15], although not impossible, seems contradicted by the word-division in this line **[Iuno.palostca]**, and the regular word-division throughout the rest of the text.)

[18] **edndre** CIL, Letta-D'Amato (*Epigrafia* 188), Poccetti (223), cf. Wachter (*Altlat. Inschr.* §190) **edṇdre**; Degrassi (*ILLRP* 303) incorrectly **edendre**.

[19] A. Prosdocimi and A. Marinetti ("Terza plurale" 108ff.) arrive at essentially the same morphological interpretation (3pl. pf.), but with needless confusion, resulting from their failure to consider syllabic notation as a graphic option, whence their apparent preference for a short-vowel *ēded(ĕ)re*. This, in turn, has certain consequences for the otherwise weakly-supported 3pl. pf. allomorph **-ĕre* (with short vowel) they attempt to reconstruct, in my view unconvincingly.

needlessly interpret as *ded(ĕ)re,* in case the form should be Latin, which remains uncertain).[20]

14.3 *Syllabic Notation in Initial Syllables*

14.3.a If, then, the prime locus of syllabic notation is the first two syllables, it remains to describe certain further patterns that appear in such cases. It will be convenient to proceed by considering not just initial syllable as opposed to second syllable, but also the interaction of these locations with stress and syllable weight. I consider first syllabic notation in initial stressed syllables.

In considering cases of syllabic omission which cannot be accounted for via syncope, Wachter (*Altlat. Inschr.* §21c) cites CIL 2908 **Crere** (Veii, early 3rd c.) as an indisputable example with initial stress, whether in terms of the early "Erstsilbenbetonung" or the later classical system. Indeed, Ernout ("Parler" 309) had already listed the similar Praenestine examples CIL 289 **Trtia** = *T(e)rtia,* 177 **Hri** = *H(e)ri.* Even if the latter is to be explained differently,[21] the important new example 2873d **Crṿi[** (**14.1.b** above) can hardly reflect anything other than *C(e)rvi-;*[22] and the same pattern appears later also in 3425 **Spdies** (Aquileia) = *Sp(e)dies.* This usage, then, is both old and widespread (note here the restriction to personal names), and indeed the preponderance of *-(e)r-* (as in the oldest examples **Crere** and **Crṿi[**, as well as the two Praenestine cippi with **Trtia** and **Hri**) may be significant, as will be discussed below (**14.5.c**).[23]

These facts, in any event, serve to strengthen the case for interpreting the fragmentary inscription CIL 2884a (Caere, 3rd c.) **]cri.pocolom** simply as **]C(e)ri.pocolom** (cf. 445 **Keri.pocolom**; for

---

[20] The line-final (and inscription-final) **deder** in the late Praenestine inscription CIL 3060 is simply an abbreviation **deder(unt)** (cf. the preceding **loc(um)** and the indentation of this line), and therefore has no bearing on the restriction under discussion.

[21] Cf. Ve 427.2: "*Hri = H(e)r(enn)i*", perhaps correctly.

[22] On the distribution of *Cervii* and the origin of the gentilicium *Cervius* ("osco-sabellico"), see now Letta-D'Amato *Marsi* 185f.

[23] In view of the above discussion, Coleman's suggestion (in *IE Numerals* 410) that Praen. **Trtia** reflects an actual **tr̥tio-* is unlikely to be correct; cf. **14.4.b** on the alleged "syllabic" value of liquids and nasals in some similar forms.

Cerus, e.g. Radke *Götter* 91 s.v.), despite the uncertainty about the broken initial section (on which see CIL p. 889).[24]

14.3.b In addition to the Latin examples already cited of syllabic notation in unstressed initial syllables (**Mgolnia, Rtela, Nmisio, Ptronio** etc., **Gminia, Dcumius**), note further CIL 3072 **Trmeili** = *Tr(e)meili* (cf. **3.2.f** above), and perhaps also 2870 **Smo** = *S(e)mo(nios)* (?) (Etruria, 3rd c.), as well as the dialectal examples Pael. *pperci* (Ve 203) = *p(e)perci* (?),[25] Ager Capen. *Pscni*[26] = *P(e)sc(e)n(n)i* (with "double" notation, cf. **Diesptr**, Umbr. *ptrnio,* Etr. *mnrva*). Apart from Pael. *pperci,* the usage here is again restricted to names, including the widespread and perhaps "traditional" (in the sense discussed above) **Ptron-** forms.

Note, moreover, that just as all instances of syllabic notation in initial stressed syllables involve *ĕ* (**14.3.a** above), nearly all examples of syllabic notation in initial unstressed syllables also involve *ĕ,* apart from the rare examples for *a* and *u* in **Mgolnia, Rtela, Nmisio,** and the relatively late form **Tlanio** (CIL 322, cipp. Praen.) = *T(i)lanio,* cf. CIL 315/316 **Tilanio** (cipp. Praen.). In principle, such a form could reflect a rare but permissible early variant, of the type **Mgolnia** for *a,* or **Rtela, Nmisio** for *u;* but a somewhat different interpretation of the form will be considered in **14.4.g** below.

14.3.c Before proceeding, it may be helpful to provide a schematic indication of the results arrived at above concerning vowel quality in stressed and unstressed initial syllables spelled with syllabic notation:

---

[24] Ernout's alleged Oscan example **trstus** (Ve 5C.10) (despite Ernout "Parler" 311 ["**terst-* ou **trist-*"] rather **trist-*, cf. **trístaamentud**) is uncertain, cf. Vetter ad loc. (p. 37): "*i* wohl durch Versehen ausgelassen"; the word, moreover, is line-final. For Ernout's alleged "Faliscan" example *Śrpios,* with recumbent closed X as the initial character (Ager Capenas, CIL 476 = CIE 8451, Ve 356c, Giacomelli *Lingua fal.* C XXVI, p. 267, cf. also Pfiffig *Etr. Spr.* 60), see now Briquel "Écriture" 833ff. (rather *Írpios,* with "South Picene" value of the initial character); cf., however, *Pscni* and *Fertrio* below, **14.3.b** and **14.4.a**.

[25] The interpretation of this form is not entirely certain, see Jiménez Zamudio *Peligno* 2 ad loc.

[26] CIL 476.4 = CIE 8449, Ve 356a, Giacomelli *Lingua fal.* C XXIV, p. 266; cf. Briquel "Écriture" 823.

	initial syllable
stressed	ĕ (esp. *-er-*) (ă ? Osc. **mr**)
unstressed	ĕ (ă: **Mgolnia**) (ŭ: **Rtela**, **Nmisio**) (ĭ: **Tlanio**)

14.4 *Syllabic Notation in Second Syllables*

14.4.a Wachter's discussion (*Altlat. Inschr.* §21c) of non-first-syllable notations not likely to involve an actual syncope is based almost entirely on forms with long vowel; thus for stressed second syllables, e.g. **Orcvio**, **Atlia**, **Matlia** (cf. **14.2.c** above), and further CIL 385 **Albsi** (Alba Fucens, 3rd/2nd c.), 2032 **debtur** (Perusia, 2nd/1st c.). Wachter observes, however (n. 123), that in **Albsi** (as in **lubs**, **libs**, cf. **14.4.c** below), the *e* was originally short, although the absence of *n* suggests that the compensatory lengthening has already taken place, and he further tentatively compares CIL 1040 **Decbr** and 1176 **Decmb** (ollae ex vin. S. Caes.).

Even if we eliminate the latter two forms as possible abbreviations, there are still other cases of syllabically notated short vowels in heavy second syllables (generally in the sequence *e* + *n*/*m*), of which some are clearly old: in addition to the archaic **Męnrva** (CIL 3491, cf. **14.1.b** above), also CIL 2874 **cosn[** = *co(n)s(e)n[* (Lacus Fucinus, 3rd c.; cf. **14.2.d** above on **edędre**),[27] 388 **Supna** = *Sup(ē)nā(s)* (Lacus Fucinus, 3rd/2nd c. [cf. **13.3.b**, **13.5.a**]; here also **lubs**), 483 **Lornti** = *Lor(e)nti* (Rome, 2nd c.),[28] and the probably later 2995 **redmtor** (Rome) = *red(e)m(p)tor* and 238 **Pescno** (cipp. Praen.) = *Pesc(e)n(n)-*.

---

[27] **cosn[** perhaps actually a theonym, see Letta-D'Amato *Epigrafia* 188 (p. 326).

[28] For *Lorentius* (contra Wachter's *Laurentius, Altlat. Inschr.* §150f, similarly Ernout "Parler" 312), see O. Salomies, *Arctos* 22 (1988) 223.

Essentially the same profile appears in the dialectal examples: in addition to Ager Capen. *Pscni* (**14.3.b** above), also Ager Capen. *Fer̨triǫ*[29] (if the interpretation *Fer(e)trio* is correct), "Sab."[30] *atrno* (Ve 227) = *At(e)rno*, Pompeiian *Terntius* = *Ter(e)ntius* (von Planta *Gramm.* 1.323).

Note, once again, that apart from the probably late examples **debtur** and **redmtor**, all other cases (including one or more third-century ones) involve (or may involve) names, in which, moreover, the phonetic environments are remarkably limited:

n(e)r : **Mẹnrva**
t(e)r : *atrno*
r(e)t : *Fer̨triǫ*
r(e)n : **Lornti**, *Terntius*
(e)n also: **cosn[** (**Cosn[** ?), **Pescno**, *Pscni*[31]

14.4.b In view of these facts, and also bearing in mind the facts that vowel quality in initial syllables involves *ĕ* almost exclusively, with a similar propensity for *(e)r*, and that Etruscan (which lacks long vowels) would appear not to provide a source for such notations, it might seem tempting to take the cases with *ē* as secondary, perhaps beginning with the compensatorily-lengthened type **Albsi** (note here originally *(e)n*, cf. **cosn[** etc.); after *(e)n(t)s* > *(ē)s*, the notation could have been extended to other (closed) *ē*'s, whence **Supna**, **edẹdre**, and the type **Orcvio** etc. (and then later cases like **debtur**). There is, however, reason to believe that the cases with *ē* in Latin have a somewhat different explanation, as will be seen in **14.5.b** below. It should be clear in any case that for heavy second syllables, there is no evidence for old **ī*.

Note finally that the almost complete parallelism between initial syllables and (so far, at least, heavy) second syllables suggests that Ernout's conception of forms like **Decmb** and *atrno* as reflecting a "syllabic" value

[29] CIL 476.2 = CIE 8454, Ve 358b (*Fertrius*), Giacomelli *Lingua fal.* C XXIX, p. 267; cf. Briquel "Écriture" 824f.
[30] Or Vestin., cf. Coleman "Central Ital." 110, 127 n. 42.
[31] Cf. *(e)m* in **Decmb**, **Decbr**, **redmtor**.

of the liquid is to be abandoned,[32] although the frequency of liquids and nasals at the ends of syllabically-notated sequences remains a fact of potential interest, to be discussed further below (**14.5.b-c**).

14.4.c I defer consideration of the remaining type of stressed second syllable (i.e. stressed light second syllable, of the type CIL 2661 **Licnio** = *Lic(i)nio* etc.), until after consideration of unstressed second syllables.

A special case, as will become clearer shortly, concerns two-syllable words, of which several old instances have already been mentioned: note CIL 62 **lubs**, 388 **lubs**, 392 **libs** (similar to **Albsi**, discussed above), and the isolated CIL 560 **misc** (Praeneste, 3rd c.), a form of some interest.

Recall first the possibility just adumbrated (**14.4.b**) with regard to **Albsi**, i.e. that syllabic notations with *ē* might reflect a secondary extension of a system originally confined largely to *ĕ*, with *ē* having arisen from lengthening of *(e)n* (apparently one of the most characteristic environments for syllabic notation). For the position in question here (unstressed second syllables of two-syllable words), the evidently archaic form **lubs** could be another form of this type. But even **misc** can be aligned with this conception, on the basis of certain morphological considerations. Historically, the *ē*-inflection of *misceō* is surprising for such a zero-grade **-sk̂elo-*formation, for which one would rather expect to find a thematic **mig-sk̂e/o-* (cf. Gk. μίσγω) or **mik-sk̂e/o-* > Lat. ***miscĕre*. In principle, then, Leumann's suggestion (*LLuF* 535) that **misc** might in fact reflect *misc(ĕ)* (and not *misc(ē)*) may be attractive not only morphologically, but also paleographically, if one grants the precedence of *ĕ* (and the secondary status of *ē*) in syllabic notation. But in the final analysis, it seems preferable to assume *misc(ē)* for **misc**: syllabic notation with *ē*, even if secondary, is already assured for the third century (cf. **edędre [14.2.d]**, **Supna [14.4.a]**, and recall Wachter's observation on the absence of *n* even in the type **Albsi**, **lubs**), and there are reasons to believe, moreover, that CIL 560 is among the later exemplars of the third-century Praenestine bronzes (cf. **7.7.c**). Nor is it clear, in any case, that

[32] "Parler" 313, perhaps following von Planta *Gramm.* 1.323; similarly on *atrno* and Osc. **tantrnaiiúm** (as possible retentions of a syllabic stage directly following syncope and before insertion of *e*) also Meiser, *Lautgesch.* 133.

misceō results from a relatively late adaptation (of the type OLat. *fulgō* > *fulgeō* et sim.), in the complete absence (apart from the uncertain *misc(ĕ)* interpretation of **misc** itself) of evidence for an old thematic **miscō* in Latin. Indeed, one might just as easily claim that, in view of forms like **lubs**, a third-century **misc** = *misc(ē)* supports the idea that *ē*-inflection is old within Latin, as Meillet has claimed.[33] It appears, then, that syllabic notation with *ē* is a well-established component of the Latin system, and not obviously extended from notations with *ĕ*.

14.4.d Two other cases, attested somewhat later, are also usually considered genuine instances of syllabic notation, perhaps correctly: CIL 216 **patr** (cipp. Praen.), 1916 **nomn** (Picenum [Cupra maritima]), in which two of the typical phonetic environments *(t(e)r, (e)n)* are again noteworthy. The latter case, however, is to some extent ambiguous: the same (relatively late) inscription uses clear abbreviations in **Truentines** = *Truentine(n)s(is)* and **quie** = *quie(scit)*, such that **nomn** could well be interpreted as an abbreviation (cf. Degrassi's transcription *nom(e)n*, *ILLRP* 780, like *quie(scit)* etc.), or at least as a kind of transitional case of an "abbreviatory" use of syllabic notation (or a syllabic notation used in an abbreviatory context). It is clear, in any case, that the generally late forms like CIL 1289 **vivt** (Rome, mid-1st c.; at line-end! see Degrassi *Imagines* 304[34]), which continue into Imperial times, do not directly reflect syllabic notations *stricto sensu*, but rather a relatively late form of abbreviatory convention, perhaps in origin related to bona fide syllabic notations (as perhaps in the old type **ded**, CIL 2486, 2873a, cf. Ve 223 [Volsc., Antinum; line-end]; Wachter §193d ad fin. ["Abkürzung bzw. Kurzschreibung"]).[35] Indeed, similar abbreviatory models can be found as early as the late third century, as in CIL 610 **consl** (**3.2.a** above with n. 38), in which syllabic notation per se is not involved, and the abbreviation is rather related to considerations of space at line-end.

---

[33] See *MSL* 13 (1905/6) 363ff., esp. 369 on *misceō* as an inherited contamination between a thematic **mik-sḱe/o-* and a stative **mik-eh₁-* (**cf.** Gk. μιγη-).

[34] The **t** is practically on the edge, and is not to be seen in Ritschl's facsimile (*Prisc. Lat.* 42M).

[35] For **vivt** et sim. (including CIL 545 **fect**) as essentially abbreviatory in nature, similarly J. André *Homm. Stéfanini* 28 n. 5, arguing against Kiss *Transformations* 49, who takes such forms to reflect actual syncopes; but see **14.4.g** below on **fect**.

14.4.e Turning now to unstressed second syllables in words longer than two syllables: examples with heavy syllable seem to be rare, but a clear Latin instance appears in CIL 343 **Volntili** (cipp. Praen., cf. 344 **Volentilia**), and an Oscan instance in **tantrnnaiúm** (bis: Ve 86, 87) 'Tanternaeorum'; note again the characteristic environments *(e)n, t(e)r*.

14.4.f Before turning to unstressed light second syllables — the most obvious locus for the problem concerning syllabic notation and syncope — it will be convenient to summarize in tabular form the conclusions reached above conerning syllabic notation in stressed heavy second syllables, in the second syllable of two-syllable words, and in unstressed heavy second syllables:

	second syllable
stressed/heavy	ĕ (esp. *n(e)r, t(e)r, r(e)n, (e)n*) ē
two-syllable words	ĕ (*t(e)r, (e)n* : **patr, nomn**) ē[36]
unstressed/heavy	ĕ (*t(e)r, (e)n* : **tantrnnaiúm, Volntili**)

14.4.g For unstressed light second syllables, consider first the relatively old instance CIL 2873a **Aplone** (Lacus Fucinus, 3rd/2nd c.), for which syncope is unlikely, if not excluded altogether: cf. the discussion in **9.2.a**, with reference to Wachter's interpretation via an "Oscoid" *Ap(e)l(l)ōnē*, spelled with syllabic notation (*Altlat. Inschr.* §186c).[37] Similary, the later CIL 1042 **Calptana** (olla ex vin. S. Caes.) seems more

[36] In addition to **misc, lubs** etc., perhaps here also in theory **(Dies)ptr**, if this spelling arose or was in use at a time before the shortening of *-ēr* (cf. Plt., Enn. *-ōr*) to *-er;* cf. also Kazanskij's plausible reconstruction of a nom. **Ious patēr* ("Nadpis'" 167) for the T. Quinctius inscription recorded by Livy (6.29.9-10).

[37] Note also inscription-final **ded** in this inscription, either as abbreviation or syllabic notation.

likely to reflect syllabic notation (for **Calp(e)t-**) than syncope, in view of the resulting cluster.

A number of other cases are more ambiguous.[38] Thus the "missing" second syllable of CIL 565 **Acmemeno** (early Praen.) 'Agamemnon' is generally assumed to result from syncope (thus recently Wachter *Altlat. Inschr.* §110h with n. 681); but this could just as easily reflect a syllabic notation **Ac(e)memeno**, applied to a form *Agemem-* resulting either from vowel assimilation or regular medial weakening, cf. 566 **Ateleta** (early Praen.) 'Atalanta'. On CIL 366 **cedre** or **ced(e)re** see **13.5.c** above, to which may be compared the well-known indeterminacies of notations like 30 **dedron**, 3048 **dedrunt**, 2874 **fecront** etc. (thus /dedron(t)/ or /dedĕron(t)/ or /dedēron(t)/, etc.).[39] Here might also be noted CIL 567 **Tondrus** (early Praen., for Τυνδάρεος vel sim.), generally interpreted via syncope (see e.g. Wachter *Altlat. Inschr.* §64b), which poses problems for the *-dr- > -tr-* rule;[40] the form could conceivably, however, reflect a **Tond(e)rus**, with vowel reduction (cf. on **Acmemeno** above). In the case of CIL 2835 **pontfex** (Rome, early 3rd c.[41]), a syncopated pronunciation of the "sonus medius" is probably to be assumed (thus Wachter §149a), although the form could also, in context (**pontfex.max**), be taken as a kind of abbreviation.

There is, moreover, another set of ambiguous forms that involve not only presence or absence of syncope, but alternations between *ĕ* and *ĭ:* thus 131 **Gemna** (cf. **14.1.c** above), and further 62, 2675a **mertod.** Such *ĕ/ĭ* alternations in fact belong to a much broader phenomenon, as shown by widespread fluctuation in the spelling of **/i/**, often resolved in favor of **<e>**

---

[38] Many of these are listed by Wachter (n. 124)

[39] To the extent that a majority of these forms are attested in Oscan- and Umbrian-speaking areas (in addition to those just cited, also e.g. CIL 2542 **couravru[nt]** [near Croton, cf. **14.2.d** above], and a series of such forms from Pisaurum: 378 **dedrot**/379 **dedro**, 381 **Lebro**), Wachter (n. 971) is probably right in taking these forms to reflect non-urban syncopes, although in such cases, as he observes, syllabic notation "ist theoretisch natürlich praktisch nie auszuschliessen". Some similar forms met with even in formal urban contexts are probably to be taken as (late) syncopes, e.g. 585.25 (Lex Agr.) **iugra**, 585.27 **[do]mneis** (cf. **domnis** in the "Getty" curse tablet, *AE* [1988] 1146, see H. Solin, *Arctos* 22 [1988] 141ff.), 585.47 **tableis** beside 585.70 **tabuleis.**

[40] Cf. Emout "Parler" 341 and Wachter n. 417; more recently on this process Szemerényi *Quellen* 25f., and (in a "glottalic" framework) Vennemann, in *New Sound* 113.

[41] For this dating see B. Frier, *TAPA* 105 (1975) 85 with n. 23; more recently also G. Pisani Sartorio and S. Quilici Gigli, *BCAR* 92 (1987/1988) 247ff. (4th/3rd c.).

(**tempestatebus, hec**, [nom. sg.] **aidiles, filea, trebibos** etc., cf. **3.2.a** and **5.1.b**). In regions (like Praeneste) where some such forms tended to be spelled with <e> (thus CIL 60 **filea**) or showed alternation between <e> (with or without syllabic notation) and <i> (thus 62 **Gemenio**, 457 **Ɔemeni**/131 **Gemna**/170 **Gminia**), syllabic notation could easily have spread to forms with "basic" /ĭ/, for which alternations *ĕ* ~ *ĭ* are not attested: hence 207 **[Nu]mtoriai** (cipp. Praen., cf. 206 **Numitori**), 1445 **Primg** 'Primig(eniae)' (Praen., here also **Dcumius**),[42] and further (to include forms other than unstressed second syllables) 564 **Diesptr** (if /-pit-/, cf. n. 12 above), and 322 **Tlanio** (cipp. Praen., cf. 315/316 **Tilanio**; see **14.2.a** and **14.3.b** above). In principle, it would be possible to interpret CIL 545 **fect** (origin unknown, on the neck of a bronze statue) as another example of this type, if not for its antiquity (3rd/2nd c.).[43] Since an early abbreviation of the type **vivt** (cf. **14.4.d** above) is unlikely, Wachter (*Altlat. Inschr.* §215c) is probably correct in taking this as a syllabic notation, but one wonders whether the form may reflect /fēket/, cf. **dedet**.

Forms like CIL 389 **Foucno** (Lacus Fucinus) are again ambiguous (thus Ernout *Recueil* 83 as syllabic notation, vs. Wachter *Altlat. Inschr.* §186f as syncope); but in view of the relatively clearer syncope type seen in **Valetudne** for this time and place (cf. **14.2.d** above), the syncope explanation is probably to be preferred for **Foucno** as well.

14.4.h We can now return to the other stressed-second-syllable type, i.e. that with light syllable (cf. **14.4.a** above for heavy stressed second syllables). A case like CIL 2382 **M.Labri** (Etruria) is a viable candidate for syllabic notation of a *Lab(e)ri(us)* (as Wachter suggests, n. 996), and a late Praenestine example like 1466 **viglias**, for which syncope is unlikely, is either an error (see Wachter *Altlat. Inschr.* §94i), or reflects the secondary syllabic notation with *C(i)* of the type (Praen.) *Prim(i)g-*, *Num(i)t-*, *T(i)lan-* etc. discussed just above. In contrast, forms like 30 **Pomplio** (Rome), 2661 **Licnio, Carpnio** (unknown [non-urban] origin,

[42] Warmington *Remains* p. 122 incorrectly **Primig**.

[43] Warmington *Remains* p. 206 incorrectly **fecit**, apparently taking the alleged "virgula" at the base of the C (cf. CIL p. 428 ad loc.) as an I, which is extremely improbable (see Ritschl's facsimiles, *Prisc. Lat.* 1C,c).

cf. **13.3.c**), and similar names among the *ollae ex vin. S. Caes.* (1091 **Licnia**, 1064 **Flamni**, cf. also 1329 **Popnia** [Rome], 2017 **Cartlia** [Clusium]) are likely to reflect non-urban syncopes, of the type Osc. **Pupdiis, Fuvfdis,** Pael. *Sabdia,* Vestin. *Ebdies, Pedlies* etc.[44]

14.5 *Final Remarks*

14.5.a The above discussion has attempted to provide certain principles that may help to disambiguate between some instances of syllabic notation and syncope. Among the inferences to be drawn from these principles is the idea that syllabic notation with vowels other than *e* is highly restricted, with deviations likely to reflect secondary developments within Latin, allowing rare instances with *a* and *u*, and certain limited usages with *i*, the latter especially characteristic of late Praenestine material. There are, however, several further observations that can be made concerning the phonetic environments found with syllabic notations, with certain further implications that can be briefly sketched concerning the relationship between syllabic notation and Etruscan, and the development of the system within Latin.

14.5.b In terms of vowel quantity, it has been seen that both *C(ĕ)* and *C(ē)* are legitimate (cf. **14.4.b-c** on *C(ē)*), and that in some cases (as for *b(ē)*: **lubs** etc.), the long-vowel option actually predominates. It is conspicuous, however, that most analyses of the generally-assumed correlation between syllabic notation and letter names (see esp. Wachter, §4c n. 12 and §§21b-c), on the basis of Schulze's pioneering work (*SPAW* [1904] 760ff. = *Kl. Schr.* 444ff.), refer only to the correlation between forms like **Dcumius** and letter names *"be, ce, de"* etc., with the form *Cĕ*. But in his monograph on the Latin letter names (cf. nn. 5 and 6 above), Gordon has shown that it is rather terms *"bē, cē, dē"* etc. that should be reconstructed at least from the time of Varro, and probably also earlier.

---

[44] Recently published late Republican examples: **Lucliae** = *Luciliae* (*AE* [1988] 433; Corfinium); **Petcio,** beside **Peticia** (*AE* [1989] 253; Sulmo). Although CIL 30 (with **M.C.Pomplio**) was found in Rome, this notation (with singular form of the gentilicium) is otherwise not characteristic of Rome (cf. **8.5.c**).

Thus, even if the system began from Etruscan values like *"be, ce, de"* etc.,[45] the extension to forms like **lubs**, **misc** etc. can be viewed as a natural development for Latin.

The most severe problems in the reconstruction of the Latin letter names surround the group referred to by Gordon as "semivowels" (F, L, M, N, R, S, X). Here note that there is reasonably good evidence for forms of the type *"ef, el, em"* etc. at least by Varro's time; thus Wachter's suggestion (n. 124) that the form **Trmeili** could be conceived of as involving a notation via *(e)m* (rather than *r(e)*) can in principle be applied to a number of other forms of this type, whether a "standard" letter like *"ce, ge"* (from the set *"be, ce, de, ge, ka, pe"*) precedes (thus **Gminia**, **Acmemeno**, **Decmb**, **Pescno**, *Pscni*, **Crere** etc.) or not (thus **Gemna**, **Volntili**), cf. further **14.5.c**, directly following.

14.5.c As for the inventory of letters susceptible of being used for syllabic notation: apart from Wachter's limited suggestion concerning *(e)m* just noted, this is ordinarily (recently and explicitly e.g. Bonfante and Radke, locc. cit.) taken to comprise only the set *b, c, d, g,* and *p* (as well as *k(a)*). But this does not appear to be the case, at least at first glance, in view of possible forms like the following (cited at various points above):

h(e) **Hri**
l(e) **Volntili**
m(e) **Gemna**, **nomn**
n(e) **Męnrva**
r(e) **Trmeili**, **Lornti**, *Ferţriǫ*, *Terntius*, **tantrnnaiúm**
s(e) **Smo**, **cosn[**
t(e) **Atlia**, **Matlia**, **Diesptr**, **Trtia**, *atrno*, **patr**

It is immediately apparent that every case involves a "semivowel" environment, i.e. in fact *(ē)l, (e)r, (e)m, (e)n,* cf. the observations above (passim) concerning the highly restricted inventories of *following* sounds characteristic of some of the syllabic notation positions. Moreover, a

[45] Although virtually nothing is known with certainty about the Etruscan letter names (Gordon op. cit. 59f.), the absence of distinctive vowel length is at least assured.

striking correspondence to these facts can be found in the Etruscan material.[46] Pfiffig's collection includes examples of all of the same syllables (spelled with syllabic notation) except *l(e)*.[47] Of these, however, an extraordinarily high percentage show precisely *(e)r, (e)l, (e)m,* or *(e)n:* thus the two examples of *h(e)* actually show *h(e)l-;* of the six non-final examples of *m(e),* five show *m(e)l/m/n;* two of the four examples of *n(e)* show *n(e)l/r;* the two examples of *s(e)* show *s(e)n-;* and four of the seven examples of *t(e)* show *t(e)m/n/r.* The same pattern is found in still other sequences as well: thus Pfiffig cites six examples for the sequences *x(e), xs(e), fs(e),* and *f(e),* every one of which shows *-(e)l/n/r,* and four of the five cases of *v(e)* show *v(e)l/r.* Even if some of these forms are to be rejected as showing neo-Etruscan syncope instead of syllabic notation, the high degree of regularity observed in these phonetic environments, in both Etruscan and Latin, is likely to be systematic; this would suggest, in turn, that at least for some (if not most) apparent cases of the type *h(e), l(e), m(e)* etc., the syllabic notation as such actually involves the following liquid or nasal (thus *(e)l, (e)m, (e)n, (e)r*), presumably related to corresponding letter names of those shapes.[48] This practice, moreover, need not be conceived of as aberrant, but rather as a regular component of the full system of syllabic notation, as this practice is attested in both Etruscan and Latin.

G. Radke (*Arch. Lat.* 83) has proposed to read **Mnenoi** (with syllabic notation for 'M(e)nenoi', cf. *Menenius*) for the sequence of the Duenos Inscription (CIL 4) generally read as **-m()duenoi.** Apart from various objections that could be raised (a **Menenus,* for example, is not otherwise attested), this suggestion would be technically acceptable, from the point of view of the syllabic notation, in view of the above discussion. There is, however, a question of chronology: as pointed out to me by Rex Wallace, syllabic notation is most characteristic of neo-Etruscan (approx.

---

[46] Notwithstanding the reservations already noted above (n. 13) concerning Pfiffig's collection, these forms provide a convenient sample that is assumed to be roughly representative, for present purposes, of the overall phonetic distribution to be assumed for the Etruscan material.

[47] Cf. Peruzzi's observation (op. cit. 148) that the extent of syllabic notation in Etruscan "suggests that it was not restricted to the specific vowel of the letter name".

[48] Cf. the similar conception of A. Grenier, *MEFR* 41 (1924) 39ff., as discussed by Gordon *Letter Names* 38.

third century and later), including some examples written in Latin alphabet (cf. *ptroni/ptronia*, **14.1.c** above). Under the circumstances, then, one might even wonder (as Wallace further notes) whether some of the Etruscan examples actually result from Latin influence, and not vice versa. However this may be, and even if it is advisable to assume a certain period of development the system underwent during the course of the early-to-mid-third century, or perhaps even slightly earlier (cf. **14.1.b** above), a syllabic notation of the antiquity of the Duenos inscription is to be regarded with considerable suspicion.

CHAPTER FIFTEEN

Co-Occurring II (Cursive E) and E

15.1 *CIL 477 and Co-Occurring II/E*
15.2 *Co-Occurring II/E in CIL I²: Survey and Conclusions*

15.1 *CIL 477 and Co-Occurring II/E*

15.1.a The third-century unguent-pot inscription CIL 477,[1] traditionally transcribed **Amor | med | Flaca | dede**, shows a striking orthographical feature, for such a brief text, namely the co-occurrence of cursive E (II) (in **med**) and normal E (in **dede**).[2] Indeed, as Wachter has observed on the basis of the facsimile, the lettering of **Amor | med** is rather more broadly-spaced, and engraved with markedly thinner characters, than that of **Flaca | dede**, and so gives a distinctly different appearance. On this basis (together with the II/E difference, which he notes), Wachter tentatively suggests that the two parts of the inscription may actually be independent, along the lines of, say, **Flaca | dede || Amor | med [...]**. One must agree with Wachter that "Autopsie des ... nirgends photographisch edierten Stücks wäre sehr wünschenswert"; in the meantime, however, several observations concerning the use of cursive E — especially in terms of its co-occurrence with normal E in archaic Latin contexts — can be added to the discussion.

15.1.b As a preliminary to defining the limits of the co-occurrence of II and E, it can be noted that such co-occurrence is in general extremely rare in the archaic material. Parallel texts such as the following, from

---

[1] Pp. 422 (with facsimile), 722; Emout *Recueil* 114, Warmington *Remains* p. 204, Degrassi *ILLRP* 1229, Wachter *Altlat. Inschr.* §1501.

[2] See Wachter on the highly unlikely "apex pro sicilico" indicating geminated *-cc-* in **Fláca** (sic CIL p. 422, Degrassi, Warmington p. 205 with query), which rules out Fay's alleged Claudian dating (similarly now also CIL p. 722 ["vix recte"], and Peruzzi *Pesaro* 182 n. 11).

contemporaneous examples of Campanian Cales ware (cf. **4.1.a**, **4.2** above), are instructive:

CIL 412a **RIITVS.GABINIO.C.S.CALIIBVS.I'IIC.TII**

CIL 412b **[R]ETVS.GABINIVS.C.S. | CALEBVS.FECIT**
CIL 412c **RETVS.GABINIO.C.S.CALEBVS.FECITE**

Such examples make it appear, then, that II and E are for the most part mutually exclusive in one and the same text. This perception is further strengthened by several cases in which apparently co-occurring II and E do not in fact belong to a single text. Thus in CIL 1405, the entire inscription is composed with E (**Valeria, emit, aedificavit, et, Valerius**), except for the last word **PILIIM = Pilem(o)**; but this concluding name has been added later by a second hand.[3] Similarly, in the fragmentary early bronze inscription CIL 2874 from Lacus Fucinus, inscribed on both sides, side (a) (with broken right edge) shows II throughout (10x), while side (b) (with broken left edge) uses E (6x). According to most analyses (see Wachter *Altlat. Inschr.* §190 for some mild reservations), the two sides contain slightly different portions of identical (or nearly-identical) versions of a single text; nevertheless, although the lettering on both sides is in many respects very similar, the consistent II/E difference, together with some others (such as rounded versus angular R and S), suggest that the two sides were engraved in different hands, as is generally assumed (in addition to Wachter's discussion, see Degrassi *ILLRP* 303 ad loc., as well as CIL p. 881). The distinction naturally becomes even more extreme in the context of non-Latin orthographies: thus in Faliscan, the earlier portion of Ve 322c shows Faliscan E, while the portion added later shows, among other differences (cf. **16.4.c** n. 39), cursive II; cf. CIL 2061, with II in lines 1 and 2 (**TIITIA, MIISIA**), but E (left-facing!) in line 3, which is Etruscan (*ar.mesi*, TLE 607 = CIE 4190).

15.1.c A more detailed look at the Cales ware inscriptions is also revealing, in a somewhat different way. A study of these productions shows

[3] Thus Degrassi *ILLRP* 945 n. 1, cf. the photograph (*Imagines* 325).

that, with very few exceptions, the "Canoleius" pieces almost never use II,[4] while the "Gabinius" pieces use II freely;[5] note also the well-known "K. Serponius" piece (CIL 416), with consistent II (7x). Since most of these pieces seem to be approximately contemporaneous, these differences, if they are indeed real, are difficult to explain on the basis of chronology. It would appear, then, that in this relatively restricted time and place one must reckon with a kind of "E-tradition" versus "II-tradition", perhaps associated with particular scribes, artisans or workshops, although the details must elude us. The possible existence of such a dichotomy, however, has a clear interest for the problem under discussion.[6]

15.2 *Co-Occurring II/E in CIL I²: Survey and Conclusions*

15.2.a Despite the above observations, there is indeed a limited number of texts that do seem to show genuine instances of co-occurring II and E; I have noted the following cases in CIL I²:

(i) 379 (cipp. Pisaur.) 1 **MATRE, DEDA** vs. 3 **DIIDRO**

(ii) 390 (Castelluccio di Lecce) 1 **VIITIVS** vs. 2 **VALETVDNE**

(iii) 393 (Aschi [L'Aquila]) 2 **IOVII**, 4 **COSTI' = COSTII** (?) vs. 5 **I'ERT** (cf. **3.3.j**)

---

[4] See CIL p. 885 for two new examples with consistent E (CIL 406q,r).

[5] Here note, in addition to the data from CIL I² (fasc. 1), also CIL 414c (**RIIT.GABIN.**, p. 721), 411d (**GABINIVS.[-].[-].FIICIT**, p. 885).

[6] Interestingly, the use of cursive F in Cales ware is rather less consistent; although use of E generally entails (via a sort of "implicational hierarchy") standard F (an exception in CIL 393.5 **I'ERT**, **15.2.a** (iii) below), forms like *fecit* appear as both **FIICIT** and **I'IICIT** even in the "Gabinius" inscriptions (e.g. 413 **SIIRVIO.GABINIO.T.S. I'IICIT** vs. 411d, n. 5 above), cf. also **FIICII** in the "Serponius" inscription, CIL 416. Such correlations, in the archaic period, among various cursive (and other local) letter forms (including L and cursive L; open O, angled S, among others) deserve a more extended analysis, which must be reserved for the future.

(iv) in various of the *ollae ex vinea S. Caesarii* (CIL 1015ff.):

(1) 1020 **AIIMILIAI** vs. **FE**
(2) 1028 **EIDVS, INTER** vs. **LVCRII**
(3) 1117 **MVNIAE** vs. **DIICE**
(4) 1156 **SIIPRONI** vs. **SIIPTE**
(5) 1157 **IIID.** vs. **DEC, SEMPRONI, TER**
(6) 1176 **VALIIR** vs. **EID, DECMḂ**

(v) 1851 (Amiternum) **L.LVCRIITIVS PET-F DIID-DON**

(vi) 1943 (ager Caeret.) **A.EGNATI.M.F.AII**[7]

(vii) 2869 (ager Capen.) **MḖRII** (cf. **6.4.c**, **7.6.f** (iii) above)

(viii) 2540a (Pompeii) II throughout, except 1 **IGNEM**, 2 **VESTRIIIS**

(ix) 2788 (Ateste, Veneto-Latin; *MLV* 121-03[8] = *LV* Es III, with photos) **SEPTVMA.SIIX.I'.T.RVTILI.VXSOR | AEMILIAE**

(x) 3358a (Magliano) 3 **EST**, 4 **VEVENE**,[9] 7 **FECERVNT** vs. 5-6 **DII | FENDIIBAT**

(xi) 3464b (Córdoba) 1-2 **TIIR | ENTIVS**

15.2.b The distribution of these cases is striking, although not surprising: with the sole exception of the *ollae ex vinea S. Caesarii*, co-occurrence of II and E is not attested in Latium (where II is not common in general), but is found in Etruria, Pisaurum, Marsian territory and

[7] But Kaibel AE (cf. CIL XI 3647), rendering this instance not entirely certain.
[8] Lejeune provides no indication of the II vs. E orthographic distinction (cf. **12.2.e** n. 25).
[9] Probably for **veneno** (H. Solin, *Arctos* 15 [1981] 105f.).

Campania (including Pompeii), as well as Ateste and Spain. Indeed, the clear "rustic" distribution of this feature is of particular interest in connection with its appearance in the Roman *ollae*, which have long been suspected of non-urban (specifically Oscan) associations.[10] Naturally, co-occurrence of II and E is likely to occur in those areas (mainly outside Latium) where II is in common use.

15.2.c The application of this evidence to a case like that of CIL 477, with which we began, is not completely straightforward, although the II/E co-occurrence there may now appear in a somewhat new light. It is certainly possible that **MIID** vs. **DEDE** constitutes an isolated genuine — and early — Roman example of a feature that otherwise does not appear to be attested in Latium (apart from the questionably "urban" — and much later — *ollae*, as discussed above); but the above survey suggests that alternative explanations may indeed be more attractive, such as Wachter's conception of the two parts of the inscription as essentially independent (cf. **15.1.a** above), or else a non-urban provenience (whether for the engraver, the object, and/or the composer of the inscription cannot of course be determined). This latter conception, in turn, calls to mind the dative **Flaca**, and the vexed and much-discussed question of the alleged Roman instances of the dative in *-a*, generally thought to be a "rustic" feature itself.[11] Indeed, apart from **Flaca**, there is only one other clear case from Rome, namely CIL 460 **[...Me]nerva.dono.de[d...]**. Both are sometimes cited to suggest that this feature might also belong to at least some urban Latin sociolects,[12] but this may well be illegitimate, in the strictest sense of the

---

[10] See especially Ernout "Parler" 343, Vetter *Hdbch.* p. 70 and CIL p. 967; further H. Solin, *Epigraphica* 51 (1989) 242ff., esp. 243 on the late-second-century dating, contra Degrassi (cf. also **14.4.h** for another feature of interest in this connection). Note that these urns provide two of the six instances of II + E co-occurring in the same word (1117 **DIICE**, 1156 **SIIPTE**), a practice which also appears in the (predominantly II-composed) Pompeii theatre-inscription 2540a.2 **VESTRIIIS** (cf. 2540b and 2540c, in the same hand, with II throughout); further 2869 **MERII**, 3358a **DIIFENDIIBAT**, 3464b **TIIRENTIVS**.

[11] See esp. Blümel *Untersuch.* 45 ("konzentriert sich besonders auf die kleinen Städte Latiums und auf Pisaurum"); for recent discussions, see Wachter *Altlat. Inschr.* §§218e-f, Villar *Emerita* 54 (1986) 45ff. and *IF* 92 (1987) 135ff., Nieto *Emerita* 56 (1988) 340ff., Peruzzi *Pesaro* 182f.

[12] Recently Joseph and Wallace "Patois" 172.

term "urban Latin":[13] in addition to the remarks concerning co-occurring II/E in CIL 477, note that the preserved portion of CIL 460 shows cursive II in both]**NIIRVA** and **DIID**[.[14]

15.2.d Note finally that the distribution **MIID** (II = *ē*) vs. **DEDE** (E = *ĕ*) should probably not be taken as systematic, despite superficial support from, say, CIL 3358a **DIIFENDIIBAT**, or 1028 **LVCRII(TIVS)**, 1851 **LVCRIITIVS**: E also notates *ē* in 3358a (here also **FECERVNT**, **VEVENE** for **veneno**), and II elsewhere commonly notates *ĕ* (cf. 1851 **DIID**, 1176 **VALIIR**), on occasion side by side with E (cf. 379 **DEDA/DIIDRO**, 2869 **MERII**).

[13] Cf. already Blümel (loc. cit.): "die stadtrömischen Belege stammen beide von Gefässen (die nicht ortsgebunden sind)".

[14] Monteil (*Éléments* 169) confusingly lists both 477 **Flaca** and 460 **[Me]nerva** (found in Rome) among his four examples of this feature, "attesté dialectalement".

CHAPTER SIXTEEN

"Complex" Punctuation

16.1 *Introductory*
16.2 *"Bina Interpuncta" and Verse-Dividing Punctuation*
16.3 *Complex Punctuation in Naming Sequences*
16.4 *Non-Latin Evidence (I): Faliscan*
16.5 *Non-Latin Evidence (II): Paelignian*
16.6 *Excursus (Non-Latin Evidence (III)): Volsc. toticu ; couehriu : sepu (Tab. Veliterna, Ve 222.3)*

16.1 *Introductory*

16.1.a As with most of the paleographic features discussed above, handbooks of Latin epigraphy have virtually nothing to say about details of punctuation in the archaic period. Wingo (*Punctuation* Ch. I) has provided a convenient survey of these standard treatments, which mainly content themselves with a very few simplistic observations about word-division, and the shapes of the limited inventory of markers used to notate it.[1]

16.1.b The study of punctuation practices in both epigraphic and manuscript sources was significantly advanced by Wingo himself, who was most interested in exploring various forms of more or less syntactic divisions within paragraphs. With rare exceptions, however, Wingo was concerned with Augustan and post-Augustan texts.[2] One such exception has already been mentioned above (**3.3.d**), in the discussion of indentation

---

[1] To the earlier handbook citations supplied by Wingo, in his discussion of the "meager information given in the standard reference works" (*Punctuation* 12f.), one may add any number of similar treatments in later manuals, e.g. Calabi Limentani *Epigrafia* 149, Fedorova *Lat. èpigr.* 60ff., Meyer *Einführung* 36f., Gordon *Introduction* 13f., 36f., Di Stefano Manzella *Mestiere* 155, Almar *IL* 43ff.

[2] The same chronological restriction applies to more recent Wingo-inspired handbook treatments that go so far as to acknowledge the existence of more complex systems (as in Almar), as well as to theoretical explorations based on Wingo's findings (see e.g. Habinek *Colometry* Ch. 2, "Punctuation in Classical Latin Texts", esp. 63-75 for inscriptional data).

practices and space punctuation in some early dedicatory and legal texts. Here I wish to reconsider several punctuation patterns treated under separate headings by Wingo, and to suggest, first, that they reflect different manifestations of a unitary phenomenon of "complex" punctuation that is securely attested for the archaic period; second, that they are rather more widespread in Republican inscriptions, especially in certain onomastic expressions, than is generally believed; and finally, that they have interesting parallels in non-Latin documents that indicate, for this feature, much the same kind of paleographic "continuum" found to exist for many other paleographic features, as already discussed.

16.2 *"Bina Interpuncta" and Verse-Dividing Punctuation*

16.2.a In a brief discussion of "bina interpuncta", Wingo notes (*Punctuation* 120ff.) that "two interpuncts placed one after the other shows that more than division between words is intended and so can be used as punctuation". This usage, according to Wingo, is very rare; he cites only the following two inscriptional examples: first, CIL 589.II.25 (Lex Anton. de Term., 71 B.C.), where the two dots after **fuit** and before **quod** seem to set off a relative clause;[3] and second, the concluding dating-formula of CIL 679[4] (104 B.C.) **[C.Fl]avio.C.f..C.Mario.C.f.cos**, where "[t]he punctuation obviously serves to separate the two names".[5]

16.2.b In an entirely different context (as part of his "Appendix II" on metrical punctuation, 140ff.), Wingo describes (147ff.) various forms of punctuation used to separate verses of poetry within an inscriptional line of text. If we abstract away the use of hederae, virgula, and other marks used in many of the late inscriptions Wingo cites, we find evidence for only two devices used in this way in Republican inscriptions, namely:

---

[3] See also Wingo *Punctuation* 73 for further discussion of several other possible (but rather more uncertain) marks (beyond word-interpuncts) appearing in this inscription, some of which seem to be used in a similar way.

[4] Here also **múrum**, apparently the earliest datable example of apex marking a long vowel.

[5] For similar discussion of (mostly later) texts with "multiple punctuation", see already Gordon and Gordon *Contributions* 183, and more recently, with numerous (esp. Augustan) examples, Habinek *Colometry* 63ff.

(i) extra space: CIL 10 (Scip. elog., Saturn.), 1531 (Vertuleiorum dedicatio, Saturn.), 1209 (ia. sen.), 1603 (dact. hex.);
(ii) an elongated dash-like sign: CIL 7 (Scip. elog., Saturn.),[6]

with these notations in all cases found together with normal word-dividing interpuncts.

16.2.c There is a single generalization, however, that subsumes both of the types of cases just described in **16.2.a** and **16.2.b**: much as in the Augustan and post-Augustan material studied by Wingo, such cases present what amounts to a "complex" or "hierarchical" usage of two graphic indicators (including extra space) chosen from among the four standard markers regularly used in this period, namely extra space, and the three signs generally used as simple word-dividers, i.e. the normal single punct, and the much rarer (horizontal) double punct[7] and dash.[8] Moreover, this "complex" usage — for which the metrical verse-separating behavior is a particularly natural venue — is clearly of some antiquity, to judge from its appearance in the Scipionic CIL 7.

16.2.d Something very much like this, and considerably older, has already been discussed in the context of the section-opening single puncts hypothesized for the Forum Inscription (cf. **1.4.d** above) beside the word-dividing double or triple puncts, a system which was compared with similar patterns in other archaic boustrophedon and serpentine contexts.

---

[6] Apparently the earliest instance of metrical punctuation, although this fact (like the punctuation itself) is rarely noted; see, however, Di Stefano Manzella *Mestiere* 155, Almar *IL* 13.

[7] As word-divider: e.g. CIL 3292a, 3292b (**4.5.b** with n. 54).

[8] As word-divider: e.g. CIL 28 (**3.3.f**), 1861, 3164 (not noted in the transcription, but see the photograph, tab. 65 fig. 2).

16.3 *Complex Punctuation in Naming Sequences*

16.3.a Within the same general framework, consider next the further example CIL 1517,[9] from about the middle of the second century:[10]

L-Paconius-Ti.f-pr
dedicavit

Here again, two signs are used in a "complex" or "hierarchical" way: the normal word-divider is a dash-like sign (cf. n. 8 above), with the patronymic expression **Ti.f**, itself with single punct marking an "internal" division, set off as a unit comparable to the other words so divided.

It is interesting to note that the original CIL transcription (p. 628) erroneously recorded the punctuation with single puncts throughout, together with the mistaken transcription **Paconios** for **Paconius**; and that moreover, the corrected treatment in CIL p. 730 silently adjusts the punctuation, while explicitly commenting only on the new reading **Paconius**.[11] Degrassi in *ILLRP*, as usual, notates no punctuation at all, and Wachter, who in general transcribes with punctuation but does not distinguish among various punctuation signs,[12] notates all of the marks as dots. But examples such as those discussed above show that even for the archaic period, there is potential linguistic interest not only in the fact of punctuation itself, and in the differing forms taken by the various signs in use, but in certain relatively subtle details of technique, including the simultaneous usage (in one and the same inscription) of two different punctuation marks, as Wingo has described.

---

[9] Pp. 628, 730, 1001 (photo tab. 138 fig. 1, cf. also Ritschl *Prisc. Lat.* 50E); Wachter *Altlat. Inschr.* §182b, Degrassi *ILLRP* 663.

[10] "Litteris pervetustis" (CIL, Degrassi), note angled L and squared open P, but "im übrigen sind die Buchstaben monumental und recht sorgfältig" (Wachter).

[11] In a similar way, Wachter (*Altlat. Inschr.* n. 906) takes Lommatzsch to task for failing to consult Ritschl's facsimile, whence the error **Paconios** (carried over from CIL X 6466), but says nothing about the corrected punctuation. Wachter himself erroneously transcribes with a line-final punct after "pr".

[12] E.g. CIL 1861 with dashes, notated by Wachter with dots (*Altlat. Inschr.* §194a).

16.3.b It would be reasonable to claim that a notation like the one just seen, which seems to set off a patronymic expression, might be idiosyncratic — a device naturally liable to surface at least once, given, on the one hand, a tradition of relatively complex naming expressions (here with four terms plus a title), and on the other, the availability of more than one punctuation mark in more or less common use. While this may be so, it should also be noted that this notation is not isolated, as can be shown first by comparison with an extremely similar example, and further via roughly comparable material in the *cippi Praenestini* (**16.3.c**), the *tituli Caeretani* (**16.3.d**), and several other isolated cases (**16.3.e**).

The general structure (including the indentation/centering design) of CIL 1517 (**16.3.**a) is naturally found in other more or less contemporaneous *tituli consulares* as well;[13] one such parallel is CIL 623, originally transcribed (CIL p. 504, similarly CIL XI 1339) as follows:

M.Claudius.M.f.Marcelus
consol.iterum

This is the transcription provided by or implied by most authorities,[14] subject to the usual qualifications concerning the failure of Degrassi and Warmington to record punctuation except in certain conventionalized forms. Nevertheless, study of Ritschl's facsimile (*Prisc. Lat.* 48F) and of the photographs (e.g. Degrassi *Imagines* 144, Gordon *Introduction* Pl. 7) reveals the use of the dash-like interpunct, but in the first line only, and there not quite consistently.[15] A more accurate transcription, then, would be as follows:

---

[13] E.g. CIL 624.1-2 (148 B.C.), 628 (146 B.C.), 637.1-2 (132 B.C.), 661.1-2 (117 B.C.? see CIL p. 927).

[14] Degrassi *ILLRP* 325, Warmington *Remains* p. 130, see further CIL p. 920 for additional references, and the end of the next footnote for Wachter's transcription.

[15] Although the length of the sign is somewhat variable, its elongated nature seems clear. Note also that for this particular feature, Ritschl is more immediately revealing than the photographs, although careful inspection of the latter under magnification confirms Ritschl's rendering. Wachter's odd transcription (*Altlat. Inschr.* §115, without reference to Ritschl) **M Claudius M f Marcelus | consol.iterum** is apparently based on a superficial inspection of Degrassi's photograph.

M-Claudius-M.f-Marcelus
consol.iterum

The similarity of the first line with the notation of CIL 1517 is immediately apparent. Precisely how to interpret the use of the punct in the second line is less clear, although it may be related to the question of the date of this inscription, which (despite the consular indication) is somewhat controversial. As E. Badian observes in his important discussion of the problem (*JRS* 58 [1968] 244f.), the traditional mid-second-century dating (155 B.C.) does not square well with the otherwise late (i.e. mostly Sullan and later) appearance of explicitly noted consular iterations.[16] For this reason, and also in view of certain features of the lettering consistent with a later dating (the traditional spellings **Marcelus** and **consol** being of little value), Badian tentatively suggests that this is a later "(re-)engraving".[17]

16.3.c Similar material of some interest can be found among the *cippi Praenestini,* although it should be noted that for this material, the CIL transcriptions (much less any others, such as those provided by Vetter) cannot in general be trusted with regard to punctuation and spacing; only examples deemed relatively certain have been included in the following discussion, with several brief (but by no means exhaustive) indications of inaccuracies in CIL and elsewhere.

Consider first the following:

(i) CIL 321 **Titoleiai-M.f**[18]
(ii) 279 **C.Saufi-A-f**

---

[16] Here note also Badian's discussion of the only other possible early example, CIL 610 (cf. **3.2.a** n. 39), on which see now T. C. Brennan (*Athenaeum* 67 [1989] 467ff.), who accepts the iteration.

[17] Perhaps of some relevance to the problem is the fact that the lettering of the second line, while apparently the work of the same hand as the first line, is distinctly larger and more deeply cut (and hence with slightly more prominent serif work) than that of the first line.

[18] **Titoleiai** is apparently mis-transcribed as *Titoleia* in Ve 487 (perhaps after CIL XIV 3277), although this is not noted at CIL p. 874, where the Vetter reference is provided; since Krummrey there notes his autopsy of the stone and does not correct the original CIL I[2] version **Titoleiai,** I take this to be the correct reading. (For the dative, cf. e.g. CIL 326 **Tondiai.L.f** vs. 327]**Tondia,** both cipp. Praen.)

The first appears to use a system like that of CIL 1517 and 623, while the second reverses the two symbols. Although the notations are not precisely equivalent, it seems clear that the various strategies employed all have the effect of separating the first part of the expression from the patronymic.

In several other examples, it is extra space (as opposed to a second punctuation marker) that is used beside word-dividing dots, again effecting a separation between the patronymic expression and the preceding material:

(iii) 335 **Vatronia M.f**[19]

Somewhat differently (note the longer form of the expression):

(iv) 2460 **Dindia Plauti.C.ux**[20]

In a similar way, lack of space (i.e. use of scriptio continua) contrasts with word-dividing punct in at least one other example:

(v) 2464 **C.Opio()C.f**[21]

16.3.d Similar phenomena appear in the other comparable set of documents, namely the numerous *tituli Caeretani* from Etruria (CIL 1931-1986, 2546-2627, 2721-2765, 3302-3336). Thus, with spacing:

(i) CIL 3316 **[(Sta?)]tori M.f**

and somewhat differently

(ii) 3311 **M()Ponti()M f**[22]

---

[19] But CIL 2469 incorrectly transcribed **Maxuma | Peinaria C.f**, since the photograph (tab. 6 fig. 8) shows crowding at the end of the second line (thus at best **Peinaria()C.f**, cf. (v) below), and possibly a punct after **Peinaria**.

[20] Similarly transcribed in *Eph. Ep.* 9, p. 454 (no. 820), vs. Ve 415.5 **Dindia.Plauti**. Degrassi (*ILLRP* 855) is as usual of no value for the problem.

[21] Photo tab. 6 fig. 7. The original CIL transcription (p. 719), with word-dividing space after **Opio**, is incorrect, as is Vetter's **C.Opio.C.f.** (447.2).

[22] "Normal" notation in 3312 **M.Ponti.M.f.Scurra.**.

Several other cases are more problematic, but potentially of great interest. CIL 1969 is incorrectly transcribed (p. 674) as **C.Pabate L.f**,[23] whereas Ritschl's facsimile (*Prisc. Lat.* 47.18) and the photograph (CIE 6285, tab. 124) reveal not only punctuation after **Pabate**, but the use of the (upward-pointing) triangular mark (otherwise commonly found in these inscriptions, as elsewhere; here notated "ʌ"), only in this position; thus properly:

(iii) **C.PabateʌL.f**

There is, to be sure, much variety in these texts between the use of circular and triangular interpuncts (for the latter including also both the "open" and "closed" forms), and many cases are simply uncertain, since it is not always easy to judge which mark is being used; nevertheless, relatively clear examples suggest that (iii) above is not isolated:

(iv) CIL 1965 **A.NumoniʌA.f** (open ʌ)[24]

and especially, with a more distinct second form of punctuation, namely the cross-hatch type:

(v) CIL 1959 **]LaviliaxM.f**[25]

16.3.e Other isolated cases, while not directly comparable to the above instances, show (or may show) similar sorts of hybrid notations. Thus in a very early example (late 4th/early 3rd c.?), a feminine praenomen (*Aula*, cf. **12.1.c** n. 7) is treated differently from the remain–

[23] Cf. CIL XI p. 1342 "Post PABATE non est punctum", correcting CIL XI 3673.
[24] Ritschl *Prisc. Lat.* 47.15 (vs. CIL **A.Numoni.A.f** = CIL XI 3670).
[25] Ritschl *Prisc. Lat.* 47.7, CIE 6274 (photo tab. 130) vs. CIL **Lavilia.M.f**. Like (iv) above also perhaps CIL 1949 (Ritschl 47.9, CIE 6262, photo tab. 115), which appears to read **T.AnniaʌL.f** (vs. CIL **Fannia.L.f**; for **Annia** see already Henzen at CIL XI 3653, similarly Ritschl *Prisc. Lat.* p. 40 contra **Fannia**).

der of the sequence based on the husband's name: CIL 28482[6] **A.Decemia()M**, i.e. 'Aula Decemia M. (uxor)'

With space punctuation, but somewhat more complex than the above examples, is the (probably late-second-century) votive inscription CIL 2435,[27] from a bronze *olpe*. Here, the initial naming-sequence appears as in CIL 3316 (**16.3.d** (i) above), with patronymic separated by space; this is then followed by another space separating the naming-expressions (or at least the preceding one) from the votive text proper:

Mar.Popi St.f N.Mart.d.d.me

Interestingly, the theonym *Numisio Martio* (which happens also to consist of a two-part expression) is itself not separated, but forms a phraseological unit, as it were, with the traditional votive formula.[28]

Similar in layout and design to the preceding (although on a smaller scale) is the circular lantern inscription CIL 504 **Statia vilic.nostra** (see the facsimile, CIL p. 424), with the name separated by space from its accompanying descriptive phrase, the two terms of which are linked with a punctuation mark. The frequency of abbreviated expressions in such patterns may thus serve to support the interpretation of **vilic.** as an abbreviation (as opposed to a spelling with syllabic notation *c(a)*), as already suggested above on other grounds (cf. **14.2.a** n. 8 and **14.2.d**).

One may note, finally, a possible isolated instance in CIL 546, the reading of which is nevertheless problematic. This inscription,[29] cut vertically on a bronze statue of Jupiter found near Orvieto, has traditionally been read either **C()Pomponi()Quir¡()opos** (e.g.

---

[26] P. 867 (with facsimile; photo tab. 5 fig. 1), Tusculum.

[27] Pp. 713, 1067 (with facsimile), Capena; Degrassi *ILLRP* 249, Warmington *Remains* p. 70; cf. Wachter *Altlat. Inschr.* n. 1000.

[28] CIL p. 713 mistranscribes with dots after **Popi** and **f**, and without spaces. Somewhat uncharacteristically, in view of his usual care with punctuation (although cf. notes 11, 12, 15), Wachter (loc. cit.) misrepresents both spacing and dots by imposing a conventionalized transcription à la Degrassi or Warmington (**Mar. Popi. St.f. N. Mart. d.d.me.**), thereby obscuring the structure of the text.

[29] Pp. 428 (Ritschl *Prisc. Lat.* 1B), 1073 (photo tab. 102 fig. 2); Degrassi *ILLRP* 1249, Ernout *Recueil* 118, Warmington *Remains* p. 206.

Degrassi[30]), i.e. *'C. Pomponi Quiri(na tribu) opus'*, or alternatively **C()Pomponi()Quir.opos** (Ernout, Warmington; more on this version below). As such, the form **opos** provides one of only two attestations of the presumed archaic ending **-os** for the nom./acc. sg. of neuter *s*-stems (cf. **Venos** CIL 550), and has therefore figured prominently in handbook treatments (e.g. Leumann *LLuF* 44, 94; Ernout *Morph. hist.* 49; Meillet-Vendryes *Traité* 145). Recently, however, Torelli has revived a suggestion of Dohrn (see CIL p. 1073 for details), according to which the text should instead be read as **C()Pomponio()Virio()pos**, i.e. *'C. Pomponio(s) Virio(s) pos(uit)'*. Wachter, in turn, offers several reservations about Torelli's interpretation (*Altlat. Inschr.* n. 1040, p. 464; "vidi"), while remaining non-committal.[31] Study of the photograph and of Ritschl's facsimile has convinced me, however, that Wachter's reservations, taken together, are weighty, namely: (1) although letter spacing is somewhat uneven, the space after **Pomponi** is relatively large, and the space before **viri** is relatively small, thus favoring the traditional **Pomponi** and **Quiri** over **Pomponio** and **Virio**; and (2) the alleged final **-o** of Torelli's **Pomponio** differs from all of the other (four!) O's precisely in having what appears to be a small continuing stroke at its base, thus favoring Q over O. Moreover, as Wachter observes elsewhere (§215c), the nearly-identical structure of CIL 545 **C.Ouio.Ouf.fect** (i.e. *'C. Ovio(s) Ouf(entina tribu) fecit'*), on the neck of a bronze bust of Medusa, supports the traditional interpretation of CIL 546. To these observations a further argument can be based on the alleged use of **pos** (= 'posuit') on a statue, which seems highly irregular: in Archaic Latin epigraphic phraseology, 3sg. **posieit, poseit, posit** etc., 3pl. **posierunt** (and abbreviated **pos**) appear almost exclusively on sepulchral inscriptions (or, much more rarely, on public monuments, cf. 1sg. **poseiuei** [CIL 638, Tab. Popill.]), and therefore almost never on moveable objects. Thus, while such a usage of *pōnō* would be out of place on such a statue, **opos**, in contrast, would be perfectly natural (cf., again, **fect** in CIL 545). It seems to me almost

[30] I.e., with the usual proviso concerning Degrassi's failure to indicate the original spacing and punctuation; even CIL (p. 428) misleadingly transcribes with spaces between words, despite the scriptio continua.

[31] Cf. §46b, in connection with the ending of CIL 550 Venos: "so wohl auch CIL 546 *opos* [?], cf. Anm. 1040".

certain, then, that Torelli's interpretation is to be rejected, and therefore that **opos** should be restored to its pride of place.

The remaining indeterminacy, then, has already been noted, concerning what may be the second I of **Quirį**, which nevertheless has a distinctly truncated appearance: the bottom half (or more) of the stroke cannot be discerned, as is clear not only from the photographs and facsimile, but from the earliest transcriptions.[32] It remains possible, then, that this mark is a punctuation sign, and not an I at all (cf. above); if so, it would serve to separate the naming expression per se (written in a somewhat irregularly-spaced scriptio continua) from its governing noun **opos**. Of the two objections to this analysis that led Ritschl to reject it (*RhM* 12 [1857] 319f. = *Opusc.* 4.279f.), only the first (i.e. the unexpected length of the sign, as compared with the standard rounded punct) is at all troubling (although not decisive); the second objection (i.e. the absence of punctuation after **Pomponi**) now seems far less cogent, in view of some of the similar sequences treated above.

16.3.f Apart from whatever descriptive interest such facts may have, they possess a certain theoretical interest as well. It should be clear, to begin with, that the various forms of "hierarchical" (or other structural) organization such notations might suggest have little, if anything, to do with intonational boundaries or other phonetic realizations often associated with "punctuation", according to a standard "transcriptional" view of punctuation (see Nunberg *Punctuation* 12ff.). Instead, material such as this provides further evidence for the analysis of graphic devices in texts in terms of "text-categories", as recently proposed by Nunberg.

Secondly, such facts are of interest in connection with the difficult problems associated with the notion "word",[33] just as the evidence of punctuation has considerable bearing on the concept of "word" in Greek.[34] Thus it seems interesting that in sequences like CIL 1517 **L-Paconius-Ti.f-pr** and 623 **M-Claudius-M.f-Marcelus**, the patronymic expressions are in effect treated like "words", as is literally the case in Umbrian,

---

[32] See already CIL XI 6720 no. 21, with earlier references.

[33] For recent studies (in a variety of frameworks) see e.g. *Slovo*, Pergnier *Mot*, Di Sciullo and Williams *Word*.

[34] See A. M. Davies, in *FS Hoenigswald* 263ff.

Venetic, Russian, etc. The same tendency may help to account for the use of "overhanging" notation as a strategy to avoid breaking a patronymic expression, as seen in some of the examples of this practice cited in **13.4** above.

16.4 *Non-Latin Evidence (I): Faliscan*

16.4.a The existence of occasional instances of "complex punctuation" (in the sense discussed above) in non-Latin (Italic) texts has been asserted by von Planta (*Gramm.* 1.49f.), and explicitly denied by Durante (*SE* 31 [1963] 251 n. 10). In some cases, textual problems are particularly severe: thus even von Planta despaired of finding clear instances in the Iguvine Tables, given the not uncommon mis-punctuations (*pequoc.astruo* VIa 40 and the like) characteristic of those texts. More recently, however, Prosdocimi has tentatively admitted the possibility that traces of a "complex" system might be visible in certain instances,[35] and the issue remains unresolved. The problem deserves a thorough investigation, which cannot be undertaken here; but there is some interest in pointing out certain striking parallels from Faliscan (**16.4**) and Paelignian (**16.5**) to some of the Latin practices discussed above. There is reason to believe, in short, that von Planta's conception was essentially correct, and the interest of such a situation is not diminished by the possibility that in one or the other case, outside influence (i.e. from Etruscan or Latin, respectively) may be partly responsible. Further support for the early use of complex systems in non-Latin texts may come from the punctuation of the Volscian "Tabula Veliterna", to be discussed in a concluding Excursus (**16.6**).

16.4.b Giacomelli's brief descriptive survey of punctuation in Faliscan (*Lingua fal.* 37f.) notes several cases in which more than one punctuation sign appears in a single text (together with several other difficult problems that must be left aside here).[36] Not surprisingly, this fact

[35] See ***Tavole*** 189 ad **IV7**, with the cross-references there noted.

[36] Note in particular the system of "phrasal" punctuation used in the Ceres-inscription (Ve 241), the principles of which (apart from the famous form **pe;paraj**, and possibly

about Faliscan has clear parallels in Etruscan; indeed, H. Hoenigswald, in his important study of Etruscan punctuation, had already seen the importance of correlating Etruscan and Faliscan practice ("Punteggiatura" 206ff., 212ff.). Hoenigswald's conclusions with regard to what he termed "mixed" punctuation — esp. texts using both single and double puncts (which he notates via the symbols *"1"* and *"2"*), sometimes also with scriptio continua — are worth citing: "Non è dubbio che qua e là nel territorio etrusco, dopo la stabilirsi dei segni *2* e *1*, si è fatto il tentativo di usarli insieme..., attribuendo loro un valore diverso; ma con altretanta sicurezza si può dire che tale distinzione artificiale *non è mai divenuta vitale.* [— italics HH] Anche negli esempi più sicuri è difficile decidere, se al segno *1*, oppure al segno 2 spetti valore più forte, ..." (214f.). Handbooks of Etruscan pay little attention to this interesting feature, preferring to dwell (understandably) on the matter of syllabic punctuation.[37] Despite Hoenigswald's later disillusionment "about the reliability of those readings, esp. on porous surfaces,"[38] some of the Faliscan facts, at least, seem sufficiently systematic to be susceptible of more precise analysis, and might eventually be profitably confronted with more narrowly Etruscan problems, although this cannot be pursued here.

16.4.c In particular, most clear instances of what appears to be complex usage in Faliscan involve onomastic expressions that pattern in much the same way as some of the Latin ones already described:[39]

---

f[i;f]iqod, cf. Giacomelli 37 n. 50) are difficult to ascertain (Giacomelli: "quasi un valore stilistico", cf. the more recent — and essentially inconclusive — discussion by R. Pfister, *Glotta* 61 [1983] 115f.), although cf. **16.4.c** below, ad fin.; similarly the irregularly punctuated (and otherwise obscure) inscription Ve 242A (cf. **7.7.i**).

[37] Thus in his discussion of punctuation, Pfiffig (*Etrusk. Spr.* 23) cites TLE 51 *vel:matunas.larisalisa / an:cn ṡuθi.ceri χunçe* [sic, see TLE ad loc. for other versions of the punctuation], with no comment as to the "mixed" system.

[38] Apud Gordon *Fibula* 21 n. 69, cited also by Pfister op. cit. 116.

[39] The following brief survey omits many instances in which the readings are unclear with regard to punctuation. In general, transcriptions follow Giacomelli's readings, which in most of these cases differ, if at all, only minimally (i.e. with regard to the presence or absence of sublinear dots) from Vetter's transcriptions. Also omitted are "improper" instances of complex punctuation of the sort Ve 322c (Giac. 121/III), in which the original inscription uses double puncts, while the portion added later uses single ones, and which therefore has only a chronological interest with regard to the two "simple" systems; cf. **15.1.b** above for the similar distinction between E and Ⅱ (cursive E) in this text.

(i) **cęsi()f:fere**
'Caesi f(ilius) Herius' (Ve 348 ~ Giac. 42)

(ii) **c()mecio:a**
cesilia
'C. Maecius A. (f.) Caesillia' (Ve 321 = Giac. 119)

(iii) **]ąi:u[o]ltiąi()lo**
'...ae Voltiae li(bertae)' (Ve 302 ~ Giac. 104)

(iv) **pola()marcia:sus( )**
'Paula Marcia Sus(onis uxor?)' (Giac. 121/VII vs. Ve 322g)[40]

(v) **cau[ia.]uecin[e]a.uotilią**
maci.acacelini:uxo
'Gavia Vecineia Volti filia, Marci Acarcelini uxor' (Giac. 121/IIa vs. Ve 322bA)[41]

The above patterns may have relevance for some texts with uncertain interpretation, as in the following:

(vi) **ca()uipi:leueli**
filea (Ve 270 = Giac. 67)

Although this is generally taken as 'Ga(via) Vibii Livelii filia',[42] the punctuation may lend support to Herbig's interpretation 'Gaia Vibia' (CIE 8075), with **uipi** spelled as an Etruscan feminine.[43] It is also worth recalling Herbig's interesting observation that the unusual full spelling

[40] Here Giacomelli (ad loc.) explicitly corrects Vetter's **polą[:]marcia** ("manca un segno di interpunzione"). Strictly speaking, the area directly following the A of **pola** (including part of the A itself) occupies a small break (see CIE 8350), which nevertheless appears to have insufficient space for a punctuation sign before the M.

[41] Ve with single punct throughout; for the **:** before **uxo** see the facsimile at CIE 8345, and the revised transcription at CIE 8345 Add. (p. 112).

[42] Recently also Morandi *Epigrafia* 11.

[43] See Herbig ad loc., citing CIE 3680 *vipi* etc.; similarly *uni*, *larθi* etc.

filea can be accounted for as a strategy to help disambiguate the gender of the expression **ca()uipi.**

There seem to be no clear cases with contrast between the older triple-punct and newer double-punct, although the following has been adduced as one such instance:

(vii) **fas[i]es:ç[ai]sią:louṛią**
louci:teti:uxor[:l]oifirtą (Giac. 73/I ~ Ve 276a)

This text, inscribed on four separate tiles, appears somewhat complicated because of the structure of the naming-sequences; but Herbig's analysis (accepted by both Vetter and Giacomelli) removes the difficulties: the (end) tile containing **louṛią | [l]oifirtą** 'Luria liberta' was added later to the original sequence 'Fassia Caesia, Luci Tettii uxor'. As for the punctuation, Giacomelli's **fas[i]es:ç[ai]sią:** differs from Vetter's **fasies:ç[ai]sią:**, the latter version leading Vetter to claim that "Die Interpunktion mit 3 Punkten ... wird ... als stärkere Trennung verwendet". But there is little evidence for either version: despite Thulin's rendering (CIE 8190), the triple punct after **ç[ai]sią** is uncertain, and Nogara's drawing does not show the one before **ç[ai]sią.**

As for the problematic Ceres-inscription (Ve 241, cf. n. 36 above), it is conceivable that more than one principle is at work, i.e. some sort of phrasal notation (the nature of which is difficult to grasp, despite the relatively clear syntactic structure), together with certain patterns more like those discussed above: thus a sequence like **euios:mama()ẓęxtos,** with gentilicium set off from its two associated praenomina (cf. **8.9.a** n. 55), is reminiscent of similar patterns (mainly involving patronymic expressions) already seen in both the Latin and Faliscan material.

16.4.d Aside from onomastic expressions, something similar appears in some of the variants of the usual sepulcral 'hic iace(n)t' formula, generally appearing with separation as **hec:cupa** (Ve 287 = Giac. 86/V, etc.). In several other instances, however, the sequence is treated differently (and so set off) from the remainder of its accompanying text:

(i) **tito:uelmineo**
tit[io:]fecupa (Giac. 144/I ~ Ve 339a)

(ii) **marcio:acarcelinio**
cauia:uecinea
hec cupat (Giac. 121/IIa ~ Ve 322bB)

(iii) **tito[:]acarcelinio:**
ma:fi.pop.petrunes.ce.f
[h]e()cu[pat] (Giac. 121/III ~ Ve 322c)[44]

and somewhat differently:

(iv) **uoltio.uecineo**
maxomo
iuneo.he:cupat
carconia (Giac. 121/IV ~ Ve 322d; **carconia** added)

and still differently, but in a way that clearly sets off the **cupat** expression:

(v) **]oçicio.cicoi:cupạṭ:ifra** (Giac. 88, not in Ve)[45]

16.5 *Non-Latin Evidence (II): Paelignian*

16.5.a In Paelignian, the famous first-century *Prismu Petieđiu* funerary elogium[46] contains two forms of complex punctuation. In view of the carelessness with which these features are generally presented in modern editions, there is some interest in describing their precise appearance.

---

[44] On four tiles, with **pop.petrunes.ce.f** added later (cf. n. 39 above).
[45] Cf. Giacomelli ad loc.: "Notevole l'interpunzione, data prima da un punto unico, poi da due".
[46] Ve 213, Bottiglioni *Manuale* 122 (photo tab. 10), Pisani *Lingue* 47, Pulgram *Italic* P 25 (pp. 134ff.), Morandi *Epigrafia* 39 (photo Tav. 31.1), Wallace *Sabellian* 92ff., Jiménez Zamudio *Peligno* 18 (with full bibliography).

The word-dividing punctuation is almost consistent, and generally appears in the frequent triangular form. There are two sorts of inconsistency, i.e. (a) the use of a different sign, and (b) the absence of any sign at all, sometimes correlated with extra space.

As noted, for example, by Jiménez Zamudio (p. 22), and despite his actual transcription, the divider between *afḋed* and *eite* (line 6) and between *lexe* and *lifar* (line 7) is not the usual triangular mark, but a circular punct.[47] The potential relevance of this distinction was seen by Vetter, who notes (p. 146) that Lindsay's pioneering interpretation of the text (*CR* 7 [1893] 103ff.) proposed full stops precisely after *afḋed* and *lexe*, such that the special markings here might notate major breaks ("Satzinterpunktion"). Interestingly, both instances occur near the end of the text — i.e., the only part in which the interpretation seems tolerably clear (although problems remain, as will be seen). Of the two, the first is universally agreed upon: sentence-final *afḋed* 'abiit' closes the main text concerned with Prisma Petieḋa, and the next sentence begins *eiteʌuus* 'ite vos', directed to readers in a way familiar from Latin *tituli loquentes:* CIL 1211 **abei**, 1212 **viator.vale**, 2161 **valebis hospes**, etc., and with plural (unusual in Latin) e.g. CIL II 1821 **valete.superI**. But the next instance concerns precisely the end of this sentence and the beginning of the next — the crux of the remaining uncertainty, which hinges on the interpretation of the forms *lexe* and *lifar* themselves. Broadly speaking, there are two approaches, as follows:[48]

(i) *lexe* is 2pl. perf. ('legistis') and ends the sentence, while *lifar* is nom. sg. (e.g. a theonym 'Liber') and the subject of the final sentence, i.e.

---

[47] This fact is easily confirmed with reference to the photographs, although editors (as commonly with matters of punctuation in Paelignian, cf. **4.3.e** with nn. 37-8) show little uniformity regarding this feature: thus Vetter properly distinguishes these two instances via dashes in his transcription (vs. dots elsewhere), while Bottiglioni marks only the second, and both Pisani and Morandi mark neither; Pulgram, claiming to offer Vetter's transcription, mistakenly indicates lack of punctuation for both instances, perhaps misinterpreting Vetter's dashes. Among earlier scholars, T. Grienberger (*KZ* 54 [1926] 57ff.) achieved notable accuracy in his descriptions of both punctuation and spacing ("Der Punkt hier wie nach 7,1 ein runder Tupf" [65], in contrast to the triangular markers he correctly noted elsewhere).

[48] For details, see most conveniently Jiménez Zamudio *Peligno* pp. 28f.

eite∧uus ... puus∧ecic / lexe.lifar∧dida∧uus ... = 'Ite vos ... qui hoc legistis. Liber det vobis ...';

(ii) *lexe* is an infinitive ('legisse' or 'legere', depending on one's analysis) governed by 3sg. pres. subj. *lifar* 'libeat', which ends the sentence, i.e. 'Ite vos ... quos hoc legisse/legere libeat'.[49]

There are many arguments for and against both views, partly involving the ambiguous inscription-final *hanustu∧herentas* (one or both nom. or acc., depending on (i) vs. (ii)). It is clear, in any case, that the idea of a "significant" punctuation mark after *lexe* is compatible only with (i). It is this interpretation, moreover, that was arrived at in most convincing fashion by P. Poccetti, in his magisterial analysis of the metrical and syntactic structure of the text and its literary-cultural background.[50] We will nevertheless have occasion to suggest a somewhat different interpretation of these marks below.

16.5.b The second form of inconsistency, while occasionally noted, is generally ignored by modern commentators, and partly misrepresented even by Poccetti, despite his otherwise meticulous presentation. I refer to the fact that punctuation is entirely lacking after the words *cerfum* (4), *fertlid* (5), *pritrome* (6), and *pacris* (6), and that in three of these instances (i.e. all but *pritrome*) there is extra space (amounting to approximately a full letter space after *fertlid* and *pacris*) where the punctuation would have been. In conjunction with these facts, it is important to note the following points: first, the punctuation signs are in many cases spaced very closely with preceding and following letters; and second, the lettering — complete with elaborate and consistent serif work — has in general been very carefully cut. Third, the reduced-size letters at the ends of lines 2 and 5 are of particular interest. Since there was adequate space at the end of line 2 for an additional letter, the small *-d* at the end of *uiđad* here (which lies directly above the normal-sized *-s* of inscription-final *herentas*) is perhaps

[49] A variant of this second approach (not widely held) takes *lexe* as abl. sg., with subjunctive *lifar* introducing the following *dida*, thus 'Ite vos ... quibus id lege oporteat det vobis ...' (F. Ribezzo, *RIGI* 14 [1930] 83).

[50] *AION* 4 (1982) 213ff. (hereafter cited as "Struttura metrica"), esp. 233f.; see also his detailed discussion of "modelli formulari" in both this text and Ve 214, *AION* 3 (1981) 259ff.

best taken as a correction. More strikingly, the small letters *-as* at the end of line 3 (*perseponas*) were in fact partly necessitated by the extra space after *fertlid* in the same line; they have nevertheless been compressed line-finally, presumably in order to prevent a word-division at line-end. In view of all these considerations, it would be highly surprising if these four instances of non-punctuation — especially the three correlated with extra space — all reflected nothing more than errors.[51] Despite Poccetti's reluctance to compare the *verse-dividing* function of space punctuation in Roman epigraphic compositions (including Saturnians, as in Ve 213, cf. **16.2.b** above) with the *colon-dividing* function apparently attributable to space punctuation in the Paelignian poem, the comparison seems to me inescapable at least on the level of technique, especially in view of the great variety of "complex" usages of various punctuation indicators surveyed above. It remains only to comment on several of the details of Poccetti's analysis.

16.5.c In describing the occasional absence of punctuation in the text, Poccetti writes ("Struttura metrica" 233): "manca qualsiasi segno di puntuazione dopo *Cerfum,* dopo *fertlid* e dopo *pacris*". The absence of punctuation after *pritrome* (cf. above!) is noted neither in this statement, nor in Poccetti's accompanying transcription (234),[52] where, however, the same three positions he mentions are described rather as containing a "spaziatura non puntuata". The confusion is compounded later (235 n. 60) in Poccetti's discussion of "le due spaziature consecutive non puntuate che separano la sequenza *pritrome pacrispuus* [sic]", whereas the sequence in question reads *pritromepacris puus*. Poccetti was at some pains to account for what seemed to him to be inconsistencies in notation (on the basis of his reconstructed colometry), arriving (235) at a characterization of "le incertezze e l'imbarazzo del lapicida di fronte ad un testo, che, proprio perché ipercaratterizzato nella lingua e nello stile, poteva, già allora, manifestarsi come non completamente perspicuo", concluding that "nell'

[51] Similarly Poccetti ("Struttura metrica" 233) on the deviations from normal word-division more generally: "L'attribuzione di questo fenomeno ad una svista o al caso ci pare improbabile in un testo così accurato ed elaborato".

[52] Despite Poccetti's accurate indication (215) of Bücheler's colometry for this line, with central caesura after *pritrome* because of the missing punctuation.

individuazione dei versi e dei *cola* il lapicida antico si sia trovato nelle stesse difficoltà e nello stesso imbarazzo dell'esegeta moderno". But a more careful consideration of punctuation and spacing together may serve to mitigate the need for such an explanation, and even to support Poccetti's colometry more strongly.

With "//" marking lack of punctuation, the last four lines of the text can be transcribed as follows (including spacing):

4 *çlisuist∧cerfum// sacaracirix∧semunu∧sua*
5 *ąetatu∧firata∧fertlid// praicime∧perseponas*
6 *afḑed.eite∧uus∧pritrome//pacris puus∧ecic*
7 *lexe.lifar∧dida∧uus∧deti∧hanustu∧herentas*

In criticizing Lindsay's break after *cerfum*, Poccetti cogently objects (233) that this word "non può essere disgiunto, in quanto specificativo, da *sacaracirix*", and provides a rather sophisticated explanation (234f.) of the anomalous caesura apparently indicated by the lack of punctuation. It should be noted, however, that the space after *cerfum* is smaller than a full letter space (as noted above), in contrast to the spaces in the next two lines. The absence of punctuation here is thus perhaps less significant than it might appear.

In all, there are five (Saturnian) cola Poccetti feels confident in reconstructing, on the basis of their semantic and syntactic unity; they can be transcribed as follows, with punctuation and space indicated as above, caesura marked via "||", and division between actual lines of text via "|" (cf. Poccetti's version, 234, marking only caesura):

//|| praicime∧perseponas | afḑed.
eite∧uus∧pritrome//pacris|| puus∧ecic | lexe.
lifar∧dida∧uus∧deti∧||hanustu∧herentas

It emerges once more that absence of punctuation correlates with caesura less consistently than space: in the second of these lines, in other words, the caesura in *pritromepacris|| puus* is clearly indicated by the space, and the absence of punctuation (i.e. use of scriptio continua) between *pritrome* and *pacris* may have no more significance than as a natural consequence of the

wish to provide for extra space after *pacris*. Finally, the use of circular puncts after *afḋed* and *lexe* (as opposed to the triangular marks consistently used elsewhere) can perhaps be interpreted somewhat differently than above, although the two explanations need not be mutually exclusive. Note that these two items appear in "enjambed" positions on the stone, despite their verse-final positioning according to Poccetti's colometry. The distinctive punctuation might therefore serve to indicate the verse-end, rather than major syntactic breaks, although the two can of course coincide. This, in turn, might suggest (despite Poccetti's arguments to the contrary) that Bücheler's assumption of a correlation between verse-beginning/verse-end and line-initial/line-final positioning on the stone was essentially correct, although the correlation was evidently not adhered to with complete strictness. If this is so, the technique of this poem compares rather more closely with what might be expected on the basis of Latin verse-dividing parallels (cf. above). We arrive, then, at a complex system not difficult to imagine in the context of Latin techniques consistent with Sullan-era practice: almost consistent word division (via triangular marks); inconsistent use of space punctuation (well attested otherwise in verse-dividing function) to indicate some colon divisions; general correlation of line-end and verse-end in the first two thirds of the poem, with a second punctuation mark indicating "enjambed" verse-ends when the original line-end/verse-end system breaks down in the last two lines.

16.6 *Excursus (Non-Latin Evidence (III)): Volsc. toticu : couehriu : sepu (Tab. Veliterna, Ve 222.3)*

16.6.a The famous Volscian bronze from Velletri[53] reads as follows:

[53] Ve 222, Pisani *Lingue* 55, Bottiglioni *Manuale* 136, von Planta 240, Conway *Dialects* 252; more recently also Pulgram *Italic* P 29 (pp. 151ff.), Morandi *Epigrafia* 42.

deue : declune : statom ⁝ sepis : atahus : pis : uelestrom
façia : esaristrom : se : bim : asif : uesclis : uinu : arpatitu
sepis : toticu ⁝ couehriu : sepu : ferom : pihom : estu
ec : se : cosuties : ma : ca : tafanies : medix : sistiatiens

The readings are entirely unproblematic;[54] indeed, for a production of this period (approx. 300 B.C. or slightly later), the lettering and the engraving technique in general are remarkably regular and precise.[55] What is of most interest for our purposes is of course what appears to be "complex" punctuation, i.e. double-punct word-dividers passim, except triple-punct dividers after *statom* (line 1) and *toticu* (line 4).

16.6.b Before proceeding with considerations of detail, it is worth remarking on another general feature of this inscription that tends to be under-appreciated. Leaving aside for the moment the opening phrase *deue : declune : statom* (followed by the first triple-punct), and the problems concerning the internal structure of the first major section *sepis ... arpatitu* (1-2), there is general agreement that the text is organized in three major units, consisting of (a) the chunk just noted, i.e. *sepis* (line 1) to *arpatitu* (end of line 2); (b) *sepis* (beginning of line 3) to *estu* (end of line 3), constituting together with (a) the (so-called) "Lex Veliterna" proper; these are then followed by (c) a sentence (line 4) specifying the names of the magistrates who "set up" (?)[56] the plaque (or a shrine to the deity under discussion, vel sim.). It is striking — and a further index of the care with which the inscription was prepared — that the end of each major section coincides with a line-end, i.e.:

1	*sepis ...*		
2		*arpatitu*	(a)
3 *sepis ...*		*estu*	(b)
4 *X, Y ...*		*sistiatiens*	(c)

[54] See **12.2.b** on the reverse c of *façia* (line 2).
[55] A well-reproduced photograph is conveniently accessible in Morandi *Epigrafia* Tav. 32.1.
[56] On *sistiatiens:* R. Wallace, *Glotta* 63 (1985) 93ff.

The compression of the lettering at the end of line 2 (where there is no space to spare) and the extra space at the end of line 3 make absolutely clear that this layout was consciously sought after — all the more surprising in an early "rustic" text, which might rather be expected to operate more loosely with line-end constraints (cf. Chapter **13** above). This text, however, makes use of the widespread convention according to which punctuation is not used at line-end: hence there is punctuation neither at the end of line 1, which falls within the middle of a phrase, nor at the ends of lines 2-4, despite the major breaks that fall at those points. The obvious care with which the inscription has been executed, however, makes it difficult to take the "aberrant" triple-punct signs as due to chance or error.

16.6.c To my mind, certain interpretive difficulties in the sequence *pis* (1) ... *se* (2) remain unresolved.[57] Nevertheless, the gist of the first unit is clear: the improper action introduced in the opening conditional phrase *sepis : atahus* (roughly 'siquis attigerit', on which more shortly) must be atoned for via an expiatory offering (*esaristrom*), with more detailed instructions given in the phrase ending with the imperative *arpatitu*.

Before proceeding, several words may be added concerning *atahus*. The phonological difficulty concerning the *-h-*, posed by the usual interpretation (i.e. as if based on a verb *"attigō"*, cf. Lat. *tangō*, OL *tagat* etc. **[1.6.c-d]**), has perhaps not been sufficiently appreciated.[58] Although there is no semantic difficulty,[59] the phonological problem may justify considering an alternative analysis: *atahus* might rather be another Italic reflex of IE **teh₂-i̯e/o-* 'steal' beside the Arch. Lat. **tatod** < **teh₂-i̯e-tōt*

---

[57] A detailed treatment of this much-discussed text cannot be undertaken here. Among the more important discussions, note esp. J. Untermann, *IF* 62 (1956) 123ff., and G. Radke in *RE* IX A, 779ff. (1961) s.v. "Volsci", both with bibliographical surveys of the earlier literature. On the question of the dialectal affiliation of Volscian, see J. W. Poultney, *AJP* 72 (1951) 113ff., and more recently esp. Coleman "Central Italic" 117ff., R. Wallace *Sabellian* 35ff. and in *FS Kerns* 383ff. (for the latter see now R. Woodard, *JAOS* 111 [1991] 825f.).

[58] See esp. Untermann, op. cit. 132f.: "möglicherweise beruht der Wurzelauslaut des volskischen Wortes, der nur auf *-gh-* zurückgehen kann, auf einer Analogiewirkung", without further explanation; Maniet "Italique" 560 says only "le *h* fait difficulté", introducing Pisani's alternative explanation (see n. 60 below).

[59] Cf. CIL 499 **ne.atigas** etc., and the discussion of such expressions by Rix, "Duenos" 208f.

(CIL 4, Duenos Inscription) identified by Rix ("Duenos"): thus here fut. II **ā-tā(i)-us(t) > atahus* directly, with *-h-* notating hiatus (cf. Umbr. *stahu*),[60] vs. contraction in Umbr. *uesticos* (VIb 25), if this reflects **uestikā-us(t)* (?).[61] Indeed, to the extent that these two forms (i.e. Lat. **tatod**, in Rix's analysis, and Volsc. *atahus*) may be mutually supportive, they would serve to favor Rix's morphological interpretation of **tatod** (and this segmentation of the form in the sequence **malos()tatod**) over Eichner's alternative **malo(s)()statod** 'soll stehlen', with zero grade **stătōd* of the same root, but with *s*-mobile variant (see "Reklameiamben" 216 with n. 104). Note finally that under any analysis, this 3sg. fut. II without final *-t* poses difficulties for the view that the Umbr. *t*-less 3sg. forms of the type *habus, couortus* etc. in the Iguvine Tables derive from a 2sg. redaction (vs. the standard earlier analysis in terms of sporadic phonological *t*-loss).[62]

16.6.d Following this first unit, then ("If anyone should 'touch' [= remove/steal] ..., he shall [offer] ..."), the second *sepis* clause — which has no fut. II verb of its own (according to the standard analysis of *sepu* 'sciens', the only candidate) — must refer to one or the other of these two actions, which now is viewed in a positive light (*pihom : estu* 'pium esto', i.e. roughly 'ius fasque esto'). The infinitive *ferom* is unfortunately ambiguous, in a technical sense, since (in dialectal contexts) it might well mean "offer", in addition to "carry/remove etc." (cf. **3.3.j**); but Untermann (op. cit. 129f.) has argued convincingly that *ferom* must here refer to what was forbidden in line 1. We arrive, then, at a structure of the

---

[60] The same function for *h* is assumed by Pisani's **ag-tā-us* (cf. Gk. ἄγος), although this is morphologically problematic.

[61] For *a- < ā-*, rather than *a(t)-*, see Untermann op. cit. 133; also **6.1.d** above, with reference (n. 7) to Untermann's later discussion, "Preverbs" 387ff.

[62] See most recently Meiser *Lautgesch.* 281, with reference to Nussbaum "Benuso". In this connection, note Meiser's discussion ("Pälignisch" 120f.) of SPi. 3sg. perf. forms of the type *opsút* (for expected **opsúh < *-d*), with analogically restored ending; so here perh. *couortus* etc. as relics regularly from **-us(e)h* (?), with *courtust* etc. (and Osc. *fefacust* etc.) the (predictable) analogical replacements. Also of interest in this connection (although not mentioned by Meiser) is the possible *deduseh* of the archaic (Sabine?) Poggia Sommavilla vase (Ve 352), if this reading of Briquel ("Écriture" 790ff.) is correct (vs. *hedusef* etc., see e.g. Morandi *Epigrafia* 15, with facsimiles and photographs [Tav. 11], and A. Marinetti, *SE* 51 [1983] 167ff., esp. 170 on *hedusef, hehusef, hehusefs* etc.).

following sort: "If anyone should remove/steal..., he shall offer...; if[, however, he should remove it]..., it shall be proper to take [it] away."

We can now return to the general problems posed by the two different punctuation signs.

16.6.e The two forms of punctuation used in this text are sometimes simply ignored by editors,[63] and sometimes notated incorrectly;[64] but they have been fairly consistently commented upon, and just as consistently regarded as a problem. Most scholars adhere to one or the other of the following views:

(i) as expressed by Vetter (ad loc., p. 156), the first triple-punct denotes a "Satzinterpunktion" (thus opening phrase on the order of 'Divae Declonae statutum', with new sentence beginning 'Siquis...'), while the second triple-interpunct (between *toticu* and *couehriu,* which according to all interpretations belong together as part of a phrase meaning 'publica curia' or 'curia populi' vel sim.) is used "aus nicht ersichtlichem Grunde";

(ii) neither triple-punct is likely to be significant, precisely because the second appears to separate a phrase which cannot be separated.

It should be noted, however, that although a statement like (ii) is explicitly offered by most scholars,[65] the first three words of the inscription are in any case generally assumed to be a separate phrase: thus, on the basis of the impossibility of breaking up *toticu ⁝ couehriu,* Untermann explicitly states that "Die dreifache Interpunktion hinter *statom* erlaubt wohl kaum einen Schluß auf die Satzgrenze", but he interprets the first phrase all the same as an "Überschrift": "Der Göttin Dekluna aufgestellt. Wenn jemand...".

Among those who deny the significance of the triple-puncts, only Durante, to my knowledge, carries this view to its logical conclusion, by suggesting that if there is in fact no pause after *statom,* "il ductus sintattico diventa più chiaro: se qualcuno toccherà ciò che è stato posto per la dea"

---

[63] Thus Bottiglioni and Pulgram transcribe with double-interpunct throughout, without comment.

[64] Thus Pisani (perhaps intentionally, see further below) notates only the first triple-interpunct after *statom;* Maniet ("Italique" 559) transcribes *deue : declune ⁝ statom.* [sic].

[65] E.g. Grienberger, *KZ* 56 (1928) 29, Untermann op. cit. 124 n. 1, Morandi op. cit. p. 152; see also next paragraph on Durante.

(loc. cit., cf. **16.4.a** above). But even if this analysis is correct (and one may compare similar structures in other *leges sacrae* of the sort CIL 401 **in.hoce.loucarid.stircus | ne[qu]is.fundatid** etc., CIL 366 **honce. loucom | nequ[i]s.violatod** etc.), it still seems likely that the preposed (or "extraposed") theonym here has something of the force of the preposed locative expressions just cited (NB: both with deictic element, **in.hoce/honce**), and amounts to a kind of topicalization or cleft: "[As for] what has been placed [here] for D. D., if anyone removes [it], ... ". In this case, the triple-punct would still be quite appropriate to signal the deictic force, as it were, of such an extraposition.

It follows, then, that the real problem is not the first triple-interpunct, which under any interpretation can be seen to make eminently good sense. If not for the problem with *toticu : couehriu,* this example could simply be cited without further ado as another probable case of "complex" punctuation, involving a particular kind of syntactic pause, the precise analysis of which may differ slightly from one interpreter to another. In view of the probable significance of this mark after *statom,* and also because of the extreme care with which this inscription was engraved in all other respects (cf. **16.5.a-b** above), one should rather explore the possibility that the second triple-punct may also somehow be significant, despite appearances to the contrary.

16.6.f To my knowledge, the only prominent authority to have claimed that the mark after *toticu* might be significant is von Planta,[66] according to whom it signals the "besonders enge Zusammengehörigkeit" of the expression *toticu : couehriu,* as in the famous *"vhe-vhaked"* (as von Planta cites the form) from the Praenestine fibula (for which one may substitute other more certainly authentic forms, cf. Fal. **pe;paraj**, n. 36 above). This explanation would perhaps be possible in the abstract, i.e. without the evidence of line 1, but strikes me as unlikely because of *statom;* it is difficult to credit (despite Lattes and von Planta) that the same "special" sign would be used first to mark a pause or separation, and then

[66] *Gramm.* 1.49f., actually following E. Lattes, *RIL* 24, ser. II (1891) 935, who cites this example in his discussion (934ff.) of "conjunctive" and "disjunctive" punctuation, esp. in Etruscan.

to indicate something like the opposite. If the triple-punct sign after *toticu* has significance, it should rather indicate a break of some sort.

It can be noted, first of all, that the identical endings of the three-word sequence *toticu : couehriu : sepu*[67] might actually be deceptive, and not reflect a unit of the sort 'publica curia sciente': *-u,* after all, can be interpreted in more than one way, and such a marking after the first item could in principle simply indicate that it "does not belong" with (i.e. should be separated from) the two following words, which themselves belong together.

In fact, a phrase like *publica curia* is less satisfactory (despite superficial parallels like *meddix tuticus*) than is generally thought, a point that only Untermann (op. cit. 127f.) seems to have seen ("Was man sich genauer unter einem **toticom couehriom* vorzustellen hat, ist nicht mit Sicherheit zu sagen"). As Untermann shows, an adjective like *toticu* is precisely inappropriate for groups that might have been referred to by a term anything like Lat. *curia,* i.e. (according to the earlier usage) the ancient family-divisions, or (according to much later, esp. Imperial usage) various senatorial bodies. In the end, Untermann simply opts for an etymological translation of the phrase on the order of "Volks-versammlung", i.e. "Comitien", assuming reference to some local group with cult-oriented responsibilities, entirely independent of anything denoted by Lat. *curia.* Moreover, the apparently masc. or neut. gender of *couehriu* is surprising, vis-à-vis *curia.*

It may also be objected (although this does not seem to have been noted before) that a phrase like *couehriu : sepu* in the meaning 'curia sciente' may be somewhat unnatural: one might rather expect a word like *sepu* to refer to a person (as does Osc. *sipus* in both of its occurrences, Ve 2.5,14 [Tab. Bant.]), while a phrase like 'with the knowledge/consent of the *curia*' might be expressed with genitive and ablative (as opposed to ablative absolute) along the lines of Osc. **senateís.tanginúd** (Ve 1 [Cipp. Ab.]

---

[67] On the morphological interpretation of the last item (cf. Osc. *sipus* 'id.') see esp. R. Wallace, *IF* 90 (1985) 123ff. I am not persuaded by Schrijver's arguments in favor of a root analysis **sh$_1$p-* (*Laryngeals* 93f.), which seem to depend on the uncertain assumption that the original perfect participle (**sēp-us-* < **seh$_1$p-us-*) would have generalized a full-grade stem; the lengthened-grade vocalism is more likely to be analogical, in which case the presumed ("pre-Italic") **sap-* (cf. Lat. *sapiō*) provides no evidence for the laryngeal interpretation.

passim, Pocc 20, etc.), **kúmbennieís.tanginud** (Ve 11, similarly 12, 18), etc.; hence precisely CIL 581.23 (SCdeBacch) **senatuosque.sententiam** (official body/dependent gen.) **utei.scientes.esetis** (individuals/agreeing nom.).

16.6.g These difficulties could perhaps be resolved in the following way. First, by taking the punctuation after *toticu* at face value, one can separate the form from *couehriu*, which may well be desirable, as just discussed. If, then, *toticu* is not an adjective in agreement with *couehriu : sepu,* it could instead be an adverb in **-ō(d)* coordinated with them, in the meaning 'aperte, coram omnibus, in publico'.[68] Both the usage problem with *sepu* and the unexpected gender of *couehriu* could be explained by interpreting *couehriu* not as 'curia', but as a masc. term **couehrios* (as if Lat. **cūrius*), corresponding in meaning to Lat. *cūriō* 'priest of a curia', if not in fact (in this context) the *cūriō maximus*. Thus, when taken seriously, this second possibly significant instance of "complex" punctuation in this text may lead to a plausible interpretation of the following sort (cf. **16.6.b-d**):

(a) (*sepis ... arpatitu*) "If anyone should [surreptitiously] remove/steal s.th. ..., he shall (offer expiation etc.)";

(b) (*sepis ... estu*) "If[, however,] anyone *publicly* [removes s.th.] — [i.e.,] with the knowledge of (his?) curial priest,[69] it shall be proper to take [it] away".

Note finally that the triple punct could also be viewed as a strategy to help indicate the (otherwise somewhat surprising) ellipsis of a verb corresponding to *atahus* in the second *sepis* clause (b).[70]

---

[68] Cf. Umbr. *toce* 'publice' in Ve 237 *toce / stahu* ; thus perhaps *toce* 'publice' vs. *toticu* 'in publico'. (The interpretation of *totco* in Pocc 6 *pleno / totco* is unfortunately obscure, see Poccetti ad loc. for discussion.)

[69] Or "the [chief] curial priest".

[70] Compare the use of virgula-like marks in some Imperial inscriptions to clarify ellipses in brachylogy, as discussed by Habinek (*Colometry* 67ff., 74f.), thus CIL VI 16521 (62 A.D.) **P.Mario ' et. | Afinio.Gallo** (= 'P. Mario [Gallo] et Afinio Gallo'), CIL VI 930 (69 A.D.) **relationem.facere ' remittere** (= 'relationem facere, [relationem] remittere').

16.6.h There is a final problem of some interest surrounding Volsc. *couehriu,* recently pointed out by Schrijver (*Laryngeals* 235). The solution proposed here, while admittedly speculative in some respects, nevertheless has interesting consequences that may justify the following discussion.

Meiser's important finding (*Lautgesch.* 45f.) that the spelling of Umbr. *ueiro* 'man' reflects a short closed /ę̄/ — and not the long /ī/ traditionally assumed — serves to remove this particular counterexample to "Dybo's law" (cf. D. Ringe in *Laryngaltheorie* 420), and therefore to support Schrijver's arguments in favor of some version of this process at least for Italic and Celtic (see Schrijver's extended analysis, *Laryngeals* 334ff.). There is also, however, a further consequence for Volsc. *couehriu* (op. cit. 235): "As to Volsc. *covehriu* 'cūriā?', *-eh-* cannot reflect either short or long **-i-* and therefore it cannot be cognate with *vĭr*". Indeed, the apparent /ē/ of *couehriu,* despite the allegedly parallel **u̯īro-* (now eliminated for Italic) of Umbr. *ueiro,* was never provided with a convincing justification.[71] It appears necessary, then, to set up **kou̯ērio-* for *couehriu,* which carries with it the seemingly unfortunate result of depriving Lat. *cūria* of its traditional etymology via **ko-u̯ir-iā* (e.g. Leumann *LLuF* 134, 226, 291), unless one wishes to separate *cūria* and *couehriu* from each other, which does not seem attractive. There is, however, no positive evidence in favor of the **ko-u̯ir-iā* etymology; in view of the **kou̯ērio-* required for Volsc. *couehriu,* it may thus be equally attractive to seek an alternative source that can encompass both forms, for which one must necessarily begin with the relatively transparent **-u̯ēr-* of **kou̯ērio-,* i.e. **ko-u̯ēr-io-*. The stem *"*-u̯ēr-"*, in turn, is formally comparable to the **u̯eh₁ro-* 'true, trustworthy' of Lat. *vērus,* OIr. *fír,* OHG *wār* etc., a connection which also seems defensible on the semantic side: thus originally not 'Männergesamtheit', but (so to speak) 'Vertrauengesamtheit', referring to a social grouping originally based on mutual trust, oath-taking, propriety, legality, or some similar conception or practice that can of course no longer be reconstructed with precision.

---

[71] Thus e.g. Untermann, op. cit. 127: "Das so bezeichnete [i.e. with *-h-*] lange *ē* darf man ... als graphische Variante für *ī* ansehen".

Now *μeh$_1$ro- is generally taken to reflect a *ro*-adjective *μeh$_1$-ro-, so segmented (recently e.g. Schrijver *Laryngeals* 141). But the correctness of this analysis may be questioned: there is, to my knowledge, no clear connection with a primary root *μeh$_1$- (with appropriate meaning), and the verbal forms that can be adduced with any certainty are either clearly denominative (thus Go. *tuz-werjan* 'doubt' [cf. OHG *wār, wāri* 'wahr'], OCS *věrovati* 'believe' [cf. *věra* 'faith, belief']), or ambiguous between denominative and primary formation, the latter necessarily with stem-final *-r-* in any case (thus ORuss. *věriti* and similar Slavic forms, even if these reflect an old formation within Slavic, which is not certain).[72] It may thus be preferable to assume rather *μeh$_1$r-o-, to which one could compare, for the root structure, the homophonous roots *keh$_2$r- underlying Lat. *cārus* 'dear' (thematic *keh$_2$r-o-, cf. *μeh$_1$r-o-), OIr. *caraid* 'loves' on the one hand, and Gk. κήρυξ 'herald', Skt. *kārú-* 'praise singer' on the other (on which see Schrijver *Laryngeals* 95), and perhaps also *kseh$_1$r-o- in Gk. ξηρός 'dry', Lat. *serēscō* 'become dry' (Schrijver op. cit. 338f.). Of particular interest for *couehriu*, then, are formally parallel Celtic forms like Gaul. *Couirus, Dubnocouirus*, W. *cywir* 'correct, true' (i.e. Celt. *ko(m)-μīr-o- < *-μeh$_1$r-o-). But just as the short vowel of OIr. *caraid* may reflect a zero grade *kar- < *kh$_2$r-,[73] there is also evidence in Celtic for what appears to be a zero grade *-μar- < *-μh$_1$r-, in forms likewise provided with prefixed *kom-, i.e. OIr. *cóir*, Mid.W. *cyweir* (Mod. *cywair*) 'correct, fitting, proper' (*ko(m)-μar-i-). Vendryes (*Lexique* C-152, s.v. *cóir*) prefers Pokorny's connection (*IEW* 1164) with the *μer- of Lat. *vereor*, Gk. ὁράω, ὄρονται, OHG *bewarōn* 'bewahren' etc. (i.e. basically "survey", whence "watch over, protect", leading to notions of propriety and the like), and states, without explanation, that the connection of these forms with W. *cywir* is to be rejected. But this latter connection[74] is semantically as attractive as that with Lat. *vereor* etc. (thus "true/truth" etc. > "correct" etc.), and may be formally superior to it. For the connection with anit *μer- to be upheld, the Celtic *a*-vocalism would need

[72] I can see no compelling semantic basis in the comparison with Ved. *vṛṇīté*, Av. *vərənĕ*, 'choose' sometimes offered (e.g. Ernout-Meillet *Dict.* s.v. *vērus*), which in any case poses intractable formal difficulties.

[73] Or alternatively a pretonic shortening via Dybo's law, see Schrijver op. cit. 343f. for discussion.

[74] On which see, for example, Pedersen *VKG* 1.64, Thumeysen *OIG* 123.

to be explained on the basis of an original **u̯r̥-i̯o-* or **u̯r̥-u̯o-* (whence Celt. **u̯ar-* regularly), which themselves would be based on ancient *i-* or *u*-stems with open inflection.[75] There is, however, no good evidence for such formations (forms like *córae* 'justice' [-iā] being rather derived from *cóir*), whereas Celt. **ko(m)-u̯īr-/*ko(m)-u̯ar-* could be explained directly on the basis of full grade and zero grade forms **kom-u̯eh₁r-/*kom-u̯h₁r-*, respectively, with full grade **ko-u̯eh₁r-* also attested in Volsc. *couehriu.*

We can now return to Lat. *cūria,* which must derive from a structure of the sort **ko-u̯Vr-iā,*[76] and for which **ko-u̯ir-iā* now seems excluded, as noted above. One can suggest, then, that *cūria* reflects a zero grade **ko-u̯ar-iā* < **ko-u̯h₁r-iā* beside full grade **ko-u̯ēr-io-* < **ko-u̯eh₁r-io-* in Volsc. *couehriu,* recovering precisely the pattern **ko(m)-u̯īr-/*ko(m)-u̯ar-* < **kom-u̯eh₁r-/*kom-u̯h₁r-* just discussed for Celtic.[77] The precise morphological interpretation of the ablaut in the Italic and Celtic forms can only be guessed at (e.g. an original root noun, cf. Gk. ἦρα in ἐπὶ ἦρα φέρειν?), but such a feature would nevertheless be consistent with the segmentation **u̯eh₁r-o-* proposed above for Lat. *vērus* etc.

---

[75] See in general Joseph *IE Laryngeals* 259ff. for discussion of this source of Celt. *CaRV-* forms to aniṭ roots.

[76] See Schrijver op. cit. 273 for the regular syncope in such a sequence.

[77] A formally similar Latin-Celtic parallel would appear in Lat. *proelium,* Mid.W. *ryvel* (Mod. *rhyfel*) 'battle' < **pro-gu̯el(h₁)-(io-),* according to G. Klingenschmitt's etymology (in *Lautgesch. u. Etymol.* 221f.).

I. *INDEX OF CITED INSCRIPTIONS*

An asterisk marks inscriptions for which a new reading has been suggested. (See also the list of named inscriptions, **I.5** below.)

I.1. *Latin*

When possible, Latin inscriptions are cited by CIL number. (CIL numbers are also used for some non-Latin (esp. Pael.) texts not citable from other standard collections.)

The order is as follows:

CIL I²
CIL (other volumes)
Degrassi *ILLRP*

III. *INDEX VERBORUM*

Languages are listed as follows:

III.1 Italic languages (with Etruscan)

III.1.a Latin (including CIL 364, 365)
III.1.b Faliscan
III.1.c Oscan
III.1.d Umbrian
III.1.e South Picene
III.1.f "minor dialects"
III.1.g Venetic
III.1.h Etruscan

followed by other (ancient) languages (**III.2** - **III.9**, listed alphabetically by name), and a concluding

section of "Remaining Languages" (**III.10**).

[NB: Material cited in Ch. **13** purely to illustrate word-division, in Ch. **15** to illustrate use of E vs. Ɛ (cursive E), and in Ch. **16** to illustrate punctuation is in general not listed, apart from some forms with linguistic or text-critical interest.]
