Latin *bēs/bessis* 'two-thirds of an *as*'*

1. Lat. (masc.) *bēs* (Cic.+), with alternate nom. sg. *bes(s)is*, was originally a notional monetary unit equivalent to two-thirds of an *as* (or, as a unit of weight, eight of twelve *unciae*, i.e. two-thirds of a *libra*), later usable to describe two-thirds of anything. Nom. sg. *bēs* is presumed to derive from earlier **bess*; cf. the word for *as*-piece itself (Cato+): Lat. *ās* (< **ass*), gen. sg. *assis*, with alternate nom. sg. *assis*. Beside *bēs*, an allegedly more archaic form "*des*" (surely *dēs*) is very weakly attested.

According to a series of older interpretations, Osc. (nom. sg.) **ḍíasiíṣ** (*ST* Po , *ImIt* Pompei), on a *mensa ponderaria*, could reflect a compound consisting of **dwei-* 'two-' followed by a form corresponding to Lat. *ās*; but even in that case, the form is "wahrscheinlich ohne direkten Zusammenhang mit l. *bēs*" (Heidermanns : with n.), and (even if related to Lat. *bēs*) would be only "entfernt vergleichbar" (Untermann :).

2. According to one prominent attitude in the literature, the background of Lat. *bēs/bessis* is unclear: thus Leumann (:) writes "Unerklärt ist *bessis*, auch *besis* (also *bē-*)," and the *OLD* etymological notice (s.v. *bēs*) simply says "[dub.]," while Meillet (*DELL* s.v. *bēs*) observes, without further comment, that "[l]es formes des noms des multiples de l'as ne s'expliquent pas bien dans le détail." Yet despite various di culties, the basic background of the word is in fact fairly clear, as other authorities acknowledge: thus Kent (: .) states that "*bes* is for *duo assis*, short for *duo* [sic] *partes assis*." And the most explicit presentation of this account is provided by *WH* (s.v., following Corssen and others): "wegen der Bed. aus **duo ass(is)* 'duae partes assis' über **duass*, **duess*, **dwess* mit abnormer Lautkürzung infolge Funktionslosigkeit." This explanation is undeniably attractive semantically, and it remains

*An earlier version of this material formed the first half of the paper presented as Vine . I am deeply grateful for the comments and suggestions I received at that time.

For details, see especially *TLL* s.v. *bēs* (. . .). The sole derivative is the adjective *bēsālis/bessālis* (Vitruv.+) 'comprising two-thirds'.

Varro, *L.* . (*bes, ut olim des*). The form "*des*" is also cited by Budé (, §); but while Budé's treatise is largely dependent on Pliny the Elder (McNeil :), Budé may well have encountered the form in Varro.

Corssen, Bücheler, von Planta, Pisani; references in Untermann : .

For discussion and interpretation of the Oscan form (which probably refers to a half-metretes, as a liquid measure), see most recently *ImIt* ad loc. (. –).

So also, in essence, the etymological notice in *TLL* s.v. (. . f.; Thurneysen), comparing Lat. *bi-* and *ās*.

This analysis is cited by de Vaan (*EDLIL* s.v. *ās*), without comment.

O print from Andrew Miles Byrd, Jessica DeLisi, and Mark Wenthe (eds.), *Tavet Tat Satyam: Studies in Honor of Jared S. Klein on the Occasion of His Seventieth Birthday*. Copyright © Beech Stave Press, Inc. All rights reserved.

merely to elucidate some of the formal di culties this account incorporates, principally the alleged "anomalous phonological reduction."

3. It will be helpful to begin by clarifying the assumptions that underlie the sequence of developments just listed. First of all, "**duo ass(is)* > **duass*" implies abbreviation or ellipsis of the original phrase (*duae partes assis* → *duo assis*), followed by univerbation; this is then accompanied by (perfectly regular) elision (*du'assis*), and then (at some point, but not necessarily immediately; more on this below) truncation of the final syllable (*du'assis* > *du'ass*, if truncation occurred at this stage). The truncated form *duass* (in this version) is then reinterpreted as a new nom. sg.

In the next stage "**duass* > **duess*", the shift to *e*-vocalism would have occurred as a result of the regular weakening of /a/ in closed syllables. But the operation of vowel weakening, in turn, implies initial stress: thus, beginning from the post-elision result of the univerbation of **dú(o) ássis* or **dú(ae) ássis* (as above), the process in question would have been **dúass* (if already truncated) > **dúess*, or (without truncation at this stage) **dúassis* > **dúessis*.

With the next development—**duess* > **dwess*, "mit abnormer Lautkürzung"—we come to the heart of the di culty. This, I suggest, is best understood as reflecting a sequence of developments, as follows (here assuming, for reasons to be specified shortly, late truncation of the final syllable):

(i) **dúessis* (the result of vowel-weakening during the initial-stress period) > **duéssis* (with shift to penultimate stress)
(ii) **duéssis* (the result of (i) above, i.e. [duwéssis], with transitional glide) > **dwéssis* (via "initial-syllable syncope", more on which below)
(iii) **dwéssis* > *bessis* (via the regular sound change **dw-* > *b-*) (with nom. sg. *bessis* partly retained, cf. §)
(iv) *bessis* is reinterpreted as gen. sg., whence a back-formed nom. sg. *bess/bēs* (cf. *ās*, gen. *assis* [§])

4. Thus the sequence identified by *WH* as involving an "anomalous phonological reduction" corresponds to the early-truncation version of § (i)/(ii) → (iii) above: there is indeed no reason to expect that disyllabic **dúess* (or **duéss*) would be resyllabified to (monosyllabic) **dwess*, nor are there parallels for such a development. Yet the anomaly can be eliminatedby assuming, first of all, that truncation of the final syllable had not yet occurred at any of the stages with initial **du-* and *e*-vocalism, and that, as already indicated schematically in § (ii) above, trisyllabic **duéssis* (the penultimate-accent avatar of **dúessis*) underwent a process of

---

Or, if one prefers, *duae* [*partes*] *assis* → elliptical *duae assis* > *du'assis*.

The weakening of /a/ to /e/ in closed syllables is regular both for medial syllables (type **pérpassus* 'endured' > Class. *perpessus*) and for final syllables (type **ártifaks* 'craftsman' > Class. *artifex*). As we will see shortly, though, the process here is likely to have been the medial one.

Thus, from the perspective of *WH*: for OLat. *duim* 'I may give' (and other disyllabic forms in the paradigm: sg. *duīs*, sg. *duit*), there are no variants (**dwim* >) †*bim* etc.; nor do forms like m. *duo*, f. *duae* 'two' have variants (**dwo*, **dwae* >) †*bo*, †*bae* (despite *bi-* 'two-' and *bis* 'twice' < **dwi-*, **dwis*). Beside the reflexive possessive **sewó-* of OLat. -, Class. *suus*, and SPi. **súaís** etc. (: Hom. *ἑός* etc.), Ital. **swo-* (OLat. *sam*, *sās*, *sīs* [Enn., Festus, Lucr.], U. **svesu**/*sueso*) probably does not reflect an Italic syncope, but simply the inherited zero-grade version of this pronoun (: Ved. *svá-* etc.); cf. *LIPP* . f.

"initial-syllable syncope," a phenomenon that (while somewhat neglected) does in fact have good parallels, both within the history of Latin and elsewhere. I first had occasion to treat the matter at the University of Georgia, in a paper presented ( ) at the th East Coast Indo-European Conference—an event hosted by Jared Klein with the consummate professionalism and boundless good nature that typify his every scholarly interaction. It is a pleasure to have this opportunity to repay, in a small way, not only that marvelous hospitality, but also his support and friendship over the course of many years.

4.1. Initial-syllable syncope is widely attested elsewhere in Indo-European, but perhaps most familiar (at least to English speakers) from Germanic, and especially West Germanic. Examples dating from the Middle English period include the following:

(i) (Lat. *corōna* 'crown' >) Anglo-Norman *coroune* > ME *crowne*
(ii) (Lat. *carō* 'flesh' → VLat. **carōnia* 'carrion' >) Old Norman French *carogne* > ME *crone* 'old hag'

As a result of later developments, with both variants remaining (sometimes with semantic di erentiation), note e.g.:

(iii) (*thoróugh* >) *through* (vs. *thórough*)
(iv) (*spirít* >) *sprite/spright*, cf. *sprightly* (vs. *spírit*)
(v) (*towárds* >) *t'wards* [Shakespeare+] (beside various other pronunciations with accented initial vowel)

And the process is widespread in Modern English; Jespersen cited:

(vi) *pram* 'baby carriage' (< *peram[bulator]*)
(vii) *p'raps* (for *perhaps*)

but this is a familiar feature of (at least) American English, in pronunciations like *p'lice* (for *police*), *p'litical* (for *political*), *g'rage* (for *garage*), *b'lieve* (for *believe*), etc.

Indeed, the last item recovers the most prominent type found elsewhere in West Germanic, as in High German forms derived from the unaccented prefixes *ge-*, *be-* (OHG *gi-*, *bi-*) before root-initial [l] and other sonorants:

(viii) NHG *glauben* (OHG *gilouben*) 'believe', *gleich* (OHG *gilīch*) 'like', *bleiben* (OHG *bilīban*) 'remain', *Gnade* (OHG *gināde*) 'mercy', etc.; and similarly in Yiddish for some such items: e.g. *gleibn*, *glaich*, *blaibn*, etc.

For further detail, see Jespersen : , (from which some of the examples cited here were drawn).

Cf. Elizabethan and dialectal Eng. *crowner*, replaced by *coroner*; similarly various Germanic currency terms: Swed. *krona*, Dan./Norw. *krone*, Du. *kroon*, etc. < MLG *krūne/krōne*.

On the basis of informal (indeed, surreptitious) field work, I can report that this feature is part of the idiolect of this volume's honorand.

The phonological environments for the process are in fact somewhat broader in German dialects, on which see Schirmunski : .

On the Yiddish forms of this type, see Bin-Nun : and Timm : f. (Warm thanks to Alexis Manaster Ramer for his advice, bibliographical and otherwise, on the Germanic material.)

4.2. Among documentable instances within the recorded history of Latin, the best-known involve initial sequences of velar (or labiovelar) followed by vowel and resonant (or glide, including unspelled transitional glide), as in the following:

(i) Class. Lat. *quirītāre* 'shout publicly' (Lucil.+) > Late Lat. **crītāre* > Ital. *gridare*, Fr. *crier* (→ Eng. *cry*)

(ii) a series of forms based on *co-agere* 'draw together' (ptcple. *co-āctus*):

a. *coāgulum* 'rennet' > Late Lat. *quāglum*, cf. *quāglāre* 'curdle' (> Ital. *quagliare*, Fr. *cailler*)

b. Late Lat. **coācticāre* 'pack together' > **quācticāre* (> Fr. *cacher* 'hide')

c. 'wool workers' (*CIL* IV Suppl. , ; Pompeii, st c.)

(iii) Class. Lat. *inco(h)āta* 'begun' > (*CIL* XI , rd c.)

(iv) Class. Lat. *cohors* 'enclosure; (military) contingent' but by Imperial Latin often monosyllabic (cf. MS spellings *chors*, *cors*, also *χώρς* in Greek sources)

4.3. It is reasonable to suppose that, like medial- and final-syllable syncope, this syncope process could have operated not just in Late Latin, but at various stages of the language. Indeed, the form *quaxāre* < *coaxāre* 'croak (of frogs)' (Suet.+, cf. Gk. *κοάξ* 'croaking noise'), with the same phonetic profile as the items in § . (ii) and (iii), provides an example of the phenomenon attested within the Classical period. It is evident for all these cases that the accentual conditioning of the syncope—i.e. the lack of accent on the initial syllable—arises from the non-initial accent determined by the Classical Latin penultimate accent rule.

Moreover, as I have had occasion to discuss earlier, all of this leads to the possibility that this process could shed light on a series of otherwise di cult or anomalous forms; and in the case of isolated material that cannot be explained on the basis of the Classical Latin penultimate accent, the process could have operated at a very early stage in which a di erent non-initial accent was available—thus a stage predating the "period of initial stress," with the non-initial accent relatable in principle to what remained of the PIE mobile accent itself. Indeed, analyses of this general type (though without consideration of the accentual ramifications) have already been proposed: a well-known example is OLat. *quirīt-* '(fellow-)citizen', *Quirītēs* 'citizens (of Rome)' (→ *quirītāre*, § . (i)), *Quirīnus* 'deified Romulus; Janus', and similar forms, all ultimately based on sequences **ko-wir-*+; e.g. *Quirīnus* < **ko-wir-īnó-*. More recently, one may cite Lat. *grūs* 'crane' < Ital. **gerṓwis* (Gąsiorowski

---

Leumann : (with earlier reference).

For items (ii) and (iii): Szemerényi : f., Hackstein : . Thanks to Ben Fortson for item (iv).

On the multiple stages of Latin syncope, see e.g. Weiss : , Nishimura : (and passim).

F. . L, P.F. . L.

Cf., provisionally, , a, , , together with Dunkel's discussion at *LIPP* . n. .

In addition to the papers cited in the preceding footnote, see further (cf. *EDLIL*) and b.

Thus von Planta : , Kretschmer , among others. De Vaan (*EDLIL* s.v. *quirīs*) rejects this etymology as "not credible phonetically (cf. *cūria*) and not very compelling semantically." But for the first objection: whatever the background of *cūria* (original division of the Roman people, later 'senate-house, assembly')—i.e., whether based on original **ko-wir-*+, as traditionally (cf. Hackstein : , with reference, for some phonological details), or **ko-war-*+ (Vine : .)—it shows *second-syllable* syncope, and thus would date from the period of initial stress. As for the semantics: I fail to see how comitative **ko(m)-* + **wiro-* 'man' would not provide a plausible etymon for a word meaning '(fellow-)citizen'.

: .). And it is evident that some such proposals are weaker or more problematic than others. In any event, the prehistoric material of this kind, which I hope to treat elsewhere, is less important for present purposes than the existence of the process within the recorded history of Latin.

5. From this perspective, then, a development **duéssis* > **dwéssis* need not be viewed as one "mit abnormer Lautkürzung" (§): it simply reflects an instance of the "late" application of initial-syllable syncope, comparable to other instances dependent on the penultimate accent (§§ . , .). The only truly "abnormal" thing would be the weakly-attested byform "*des*" (i.e. *dēs*; §), if in fact this virtual hapax reflects a real form at all. Insofar as the word has been noticed, it has been placed together with a series of compound forms showing unexpected *di-* for *bi-* 'two-' (mainly attested in glosses and grammatical literature), of the type *diennium* (~ *biennium* 'two-year period'), *dīmus* (~ *bīmus* 'lasting two years, two-year-old'), *divium* (~ *bivium* 'intersection, crossroads'), *difāriam* (~ *bifāriam* 'twofold'), and others. These forms are generally (and perhaps correctly) considered to be Grecizing variants of the regular Latin *bi*-forms, based on Gk. *δι-* 'two-'. But this is not attractive for *dēs*, which (as a variant of *bēs* < **du'ass-*) would never have had a background involving *bi-* as such. As hinted at already in *WH*, Lat. *dēs* may rather continue a remnant of the **dw-* stage, but with an irregular (perhaps allegro) reduction treatment **dw-* > *d-*, distinct from the regular treatment **dw-* > *b-*.

6. A final point of interest is that this particular instance of initial-syllable syncope can be dated rather precisely, within about a -year period in the history of early Latin. The completion of the (initial-stress-based) vowel weakening (as in **dúassis* > **dúessis*) would have occurred by about , with the establishment of the penultimate accent around the same time. The initial-syllable syncope, based on the penultimate accent, follows next

---

Thus Lat. *quaerō* 'ask' < **ko(w)-aís-e/o-* (: PIE **h₂eis-* 'id.'; Ved. *icchā́ti* 'desires', etc.), desid. *quaesō* < **ko(w)-aís-se/o-* (Szemerényi , followed by Meiser [: , :], Hackstein [:], and others; cited by *LIPP* [. , with question mark]) can be viewed, on its face, as phonologically di cult: given *cōgō* 'gather; compel' < **ko-agō*, one might rather expect **ko-ais-e/o-* to result in **kōisō* > †*cūrō*, *-ere* (barring special circumstances one may attempt to justify). See *EDLIL* s.v. *quaerō* for an entirely di erent account, following Nussbaum .

In concise formulations, omitting many details, representative prehistoric examples include Lat. *focus* 'hearth' < pre-Lat. **θwoko-* < **θowó-ko-* (or **θowo-kó-*) < ("τομός form") **dʰogʷʰ-ó-* 'burning' plus nominalizing (Italic) **-ko-* (Fruyt); Lat. *bonus* 'good', perhaps **'generous' (OLat. -, OFal. **dueno**-) < pre-Lat. **dweno-* < **duwenó-/*dowenó-* or **duwéno-/*dowéno-* (: **duH-* or **duh₃-* [Ved. *dúvas-* 'favor, gift'] or **duh₁-* [TA *tsuwā-* 'stick together', Go. *tewa* 'order'; Neri :] or Ital. **dow-*, cf. OFal. **douiad** 'shall give'); Lat. *fimus/fimum* 'dung' < pre-Lat. **θwimo-* < **θuwimó-* or **θuwímo-* < **dhuh₂-i(-)mó-* or **dʰuh₂-í(-)mo-* 'smoking' (: **dʰuh₂-*, Lat. *fūmus* 'smoke' etc.).

And also displaying the same (or virtually the same) phonetic environment as the prehistoric instance **duweno-* (or **doweno-*) > **dweno-* (n.).

It is absent from *EDLIL*, and appears even in *DELL* only as an empty lemma providing a cross-reference to the entry *bēs* (where the form goes unmentioned).

See *WH* s.v. *biennium*, with further references.

In addition to *WH* (loc. cit.) and the references cited there, see more recently Leumann : .

"Varros *dēs* 'bes' (wenn nicht für **dvēs*)" (s.v. *biennium*).

For **dw-* > *d-*: compare, typologically, the same development in Greek, as in *δι-* itself (< **dwi-*), *δέος* 'fear' (< **dwéyos*), etc. (Rix :).

On the dating of these processes, see e.g. de Vaan in *EDLIL* .

(i.e. **du(w)éssis* > **dwéssis*), but necessarily precedes the treatment **dw-* > *b-*, which is datable to about .
