Latin SALVIDENVS, SALVIDENA (*CIL* I^2 1813): Morphology, Orthography, Culture

1. *CIL* I^2 1813 and the problem with SALVIDENVS, SALVIDENA

E. Dupraz, in his rich treatment of the Republican Latin inscriptions in Vestinian territory (2010), has uncovered many details testifying to the sociolinguistic complexity of the region during that period. One of these concerns *CIL* I^2 1813 (IX 3639), from Civita di Bagno (L'Aquila),[1] an epitaph of a *libertus* and a *liberta,* both associated with the same mistress. The *libertus* evidently died first, as the two-line inscription for the *liberta* (lines three and four) and the final two lines referring to both parties were added to the stone later. The text, in Dupraz's transcription,[2] reads as follows (together with his translation):

(1) Q(*uintus*).SALVIDENVS. Ↄ(*aiae*). L(*ibertus*)
GETA
SALVIDENA. Ↄ(*aiae*). L(*iberta*)
PALAESTRA
NISI QVORVM. NOMINA
INS(*cripta*). S(*unt*). INFERETVR NEMO
"Quintus Salvidenus, affranchi d'une femme, Geta. Salvidena, affranchie d'une femme, Palaestra. Sinon ceux dont les noms sont gravés, personne ne sera déposé."

In view of the letter forms and the formulaic phraseology in the final two lines, Dupraz reasonably concludes (2010, 220-221) that the inscription dates from the final decades of the first century BCE, or perhaps a bit earlier. He goes on to observe that the text is composed and written "dans un latin parfaitement classique". The sole linguistic element "d'origine indigène" (2010, 222) – i.e., with reference to the Vestinian (or more generally, in terms of the linguistic region as a whole, "North Oscan") provenance – is the gentilicium SALVIDENVS/SALVIDENA, which Dupraz analyzes as follows, in terms of a "double derivation". The basis is the Oscan name **salwyo-*,[3] to which an Oscan-style deriva-

---

1 V 7 and V 7 *bis* in Dupraz's numeration; see his detailed study of the text (2010, 219-222).

2 Based in part on autopsy, as he explains (2010, 220).

3 Cf., for example, nom. sg. masc. **salaviis** (Cp 3 [Capua]), as a gentilicium (on which see Salomies 1987, 88ff.) (Texts from Sabellic languages are cited here after Rix 2002.)

tion via the suffix *-*idyo*- has been applied, yielding a form **salwīdyo*-.[4] Then, **salwīdyo*- has been extended via the suffix -*ēno*-, originally at home in Umbrian,[5] but then extended more broadly to the east and south, whence its appearance in Vestinian territory and other Sabellic-speaking areas, as well as numerous attestations in Latin (*Alfēnus, Labiēnus,* etc.).[6] Both of these formants, not surprisingly, are well-represented in Dupraz's corpus.[7] But there is a problem: the second derivational step (i.e., the suffixation in -*ēno*-) seems to have been applied to what Dupraz calls an "elided" stem **salwīd*-, lacking its otherwise basic *y*-formant, which should have produced an outcome SALVIDIENVS (itself indeed well attested), and not the form "SALVIDENVS" found here. Yet the actuality of the latter form (as opposed, for example, to considering it an engraver's error) is guaranteed by the appearance of its corresponding feminine SALVIDENA (vs. expected SALVIDIENA)[8] on the same stone. For Dupraz, this "elided" morphology is somehow connected with the onomastic complexity of the region: an Oscan praenomen successively receives a "double suffixation" first by an Oscan formant and then by an Umbrian one, and the resulting entity is then integrated into the purely Latin onomastic context in the text at hand (including the Latin praenomen of the *libertus*, despite his probable eastern background, revealed by his slave name *Geta*).

There is indeed some complexity here; but such an "elision" reflects, strictly speaking, a surprising and questionable degree of morphological complexity, a vague concept that in any case explains very little. What specifically are we to make of such suffixal "elision" or "truncation", in the face of a great many regularly-formed items in -*idienus*?[9] Such "*y*-truncation" displays a type of morphological complexity that is simply anomalous. Dupraz briefly considers (2010, 222n6) but (quite properly) rejects the possibility of a variant suffix form *-*ido*- here, instead of the usual *-*idyo*-; and indeed, he offers no evidence (other than

---

4 In North Oscan territory, cf. the Paelignian gentilicium *salauidies* (Pg 59 [Corfinium]). The name is attested in Latin contexts as *Salvidius, Salvedius, Salviedius* (*Repertorium* p. 161).

5 As in gen. sg. masc. *uoisiener* (Um 10 [Assisi]), cf. the abbreviated praenomen *uois.* (for nom. sg. masc. *uoisis*) in the same text. (On the interpretation of U. *uois.*, see most recently Hadas-Lebel 2008.)

6 On the Umbrian background and the morphological analysis of *-*ēno*-, see Schulze (1904, 55, 104-105, 438); Rix (1972, 727-728); Rau (2007, 60n24).

7 E.g., CAESIDIA, BILLVCIDIVS, and (with the dissimilated variant -*edio*-) NOVELLEDIVS, PONTEDIV[*s*]; SAPIENA, AIENVS, CAESIENVS.

8 Attested (with "I longa") as SALVIDIENA, *CIL* VI 4816.

9 *Annidienus, Aufidienus, Avidienus, Cassidienus, Lusidienus, Nasidienus, Sabidienus, Vibidienus,* and perhaps two dozen more (*Repertorium* p. 279).

the *explanandum* at hand) that could support such a variant.[10] At bottom, after all, there would be little difference between an unsupported suffix variant *-*ido*- and an anomalous derivational "truncation" or "elision" of *-*idyo*- to *-*ido*-. But the nature of the problem is more complex than it appears from this single form.

2. Further background to the problem

There is, to begin with, a series of other attestations of *Salvidenus/Salvidena*: the name is found occasionally in Rome,[11] but far more often elsewhere, particularly in original Sabellic-speaking areas.[12] Moreover, *Salvidienus/Salvidenus* is not the only gentilicium that displays such an alternation: cf. also *Aufidienus/Aufidenus, Desidienus/Desidenus*,[13] *Camidienus/Camidenus, Nasidienus/Nasidenus, Passidienus/Passidenus, Sibidienus/Sibidenus,*[14] *Tettidienus/Tettidenus*[15] (*Repertorium* 278-279). To fill out the picture even further, *-idenus* itself (without attested pendant in *-idienus*) is found in about a dozen other names of the same structure (i.e., excluding, for the moment, names based on monosyllabic stems, of the type *Fidenus, Tidenus*): *Afidenus, Alfidenus, Babidenus, Cabidenus, Calidenus, Lancidenus, Ovidenus,* and others (*Repertorium* p. 278).[16]

Viewed in light of such data, the anomaly is even greater than it appears from the single example Dupraz has identified. Thus, just as the clear Oscoid bases **salwyo*- and **salwīdyo*- (cf. §**1.** above, with nn. 3 and 4) lead one to expect *Salvīdiēnus,* but not the Vestinian-Latin SALVIDENVS/SALVIDENA attested in *CIL* I^2 1813 (and elsewhere), the following are similarly unexpected:

> O. **babbiis**,[17] Lat. *Babidius,* but Lat. *Babidenus* (**Babidienus* unattested)
> O. **úvis**,[18] *ouiedis* (cf. Lat. *Ovidius, Oviedius*), but Lat. *Ovidenus* (**Ovidienus* unattested)

---

10 We will have occasion to consider below (in §**5.**) other alleged cases of morphological "*y*-truncation" in Italic onomastics.

11 E.g., *CIL* VI 14616, 15631.

12 E.g., *CIL* X 2408 (Puteoli), *AE* 1992.473 (Amiternum), *AE* 1988.469 = 2000.+401 (Reate), *AE* 1975.226 (Venosa); in Faliscan territory, *AE* 1991.679b. On the *Salvidieni* in Regio IV (Samnium), with special reference to Q. Salvidienus Rufus and the Vestinian or Sabine origin of the family, see Torelli 1982, 189-190.

13 Also *Disidienus*/*Disidenus*.

14 Cf. also *Sabidienus*.

15 Here also *Tittidienus*.

16 Left aside here are further derivatives in *-idenius* (*Repertorium* pp. 246-247), with or without pendant forms in *-id(i)enius,* which add nothing important to the overall picture.

17 See Lejeune (1976, 82) on the expressive gemination.

O. τιτιδιεσ (cf. Lat. *Tettidius, Tettiedius*), but Lat. *Tettidenus* (beside *Tettidienus, Tittidienus*)

perhaps among others.[19] These, then, stand in contrast to an entirely expected pattern of the sort O. **vibis**, **vibieis**, etc. (cf. U. **vipies**), O. *uibedis* (cf. Lat. *Vibedius*/*Vibidius*), and Lat. *Vibedienus*/*Vibidienus* (but no **Vibedenus*/**Vibidenus*);[20] or, similarly, U. **kluviier**, Lat. *Cluvidius,* and *Cluvidienus* (but no **Cluvidenus*).

3. Approaches based on analogy

Given the nature of these data (and of Latin onomastic patterning more generally), it is not difficult to imagine that analogical pressures could have led to the spread of a formant "*-idēnus*", at least to some extent. Thus, for example, O. *aufidis,* U. **ufeřier** correspond to Lat. *Aufidius*, and here we find Lat. *Aufidenus* beside *Aufidienus* (already cited in §**2.**), superficially similar to the forms identified above as anomalous: *Salvidenus, Camidenus, Tettidenus,* etc. (beside expected *-ienus* forms), and (without parallel *-idienus* forms) *Babidenus, Ovidenus,* etc. Yet beside *Aufidenus* (best attested in Umbria; cf. §**1.** above, with n. 6 on **-ēno-*), plain thematic *Aufidus* is also found.[21] Thus *Aufidenus* could simply result, in theory, from the productive pattern *…C-o-* → *…C-ēno-* (**Alf-o-* → *Alf-ēnus,* etc.) applied to a basic *Aufidus,* rather than reflecting an anomalous "truncated" or "elided" derivation from *Aufidius*. Cases like this could then have led speakers to deduce the existence of a formant "*-idēnus*", which (given *Aufidius*) could then have been generalized to other "*-idio-*" forms, yielding the anomalous pattern *-idio-* : *-idēno-* in question (beside regular *-idio-* : *-idiēno-*).

It seems undeniable that "*-idēnus*" has spread secondarily, and something like the above scenario may well have been a contributing factor. But this is unlikely to be the whole story. It is not encouraging, to begin with, that there are relatively few cases of the *Aufidus*/*Aufidius* sort. Conceivably, one might seek

---

18 And Lat. *Ovius*; Salomies (1987, 82-83).

19 Thus Lat. *Sabidienus* is the expected correspondent to O. σαβιδιον (cf. Lat. *Sabidius*); but here may also belong Lat. *Sibidenus* (beside *Sibidienus*), cf. also *Subidius* for the unstable root vocalism. Likewise perhaps U. *uois., uoisiener* (n. 5 above), but *Voisidenus* (*CIL* XI 5749; Sentinum, in Umbrian territory).

20 On the Oscan background of *Vibius*: Salomies (1987, 96-97); see also Weiss (2010, 371ff.) on the etymology. Dupraz (2008) demonstrates the continued productivity of both *Vibius* and *Salvius* (cf. nn. 3 and 4 above) in North Oscan territory.

21 E.g. (also in Umbrian territory) *CIL* XI 6550 (Sarsina); perhaps ultimately identical to the hydronym *Aufidus*.

additional support from some of the "monosyllabic" cases like *Fidenus* (referred to briefly in §2.). For example, despite *Fidius,* the attested *Fidenus* (vs. unattested **Fidienus*) could have been supported by speakers' presumption of a connection with *fīdus* 'trustworthy'; and this, in turn, might have lent support to *Afidenus* (beside *Afidius*) and perhaps *Fadenus* (beside expected *Fadienus*), despite O. fαδιϲ and Lat. *Fadius*.[22] Nevertheless, all of this fails to account for a series of interrelated facts, beginning with the prominence of the unexpected pattern precisely in onomastic material based on Sabellic praenomina, along with the fact that "*-idēnus*" forms are best attested in original Osco-Umbrian territory, including the most frequently-attested such form of all, which is indeed *Salvidenus*. This form, moreover, lacks entirely a corresponding simple thematic †*Salvidus* (or †*salvidus*), just as there is no †*Ovidus* (or †*ovidus*) beside *Ovidenus,* no †*Nāsidus* (or †*nāsidus*) beside *Nasidenus,* etc. The conclusion to be drawn, therefore, is that even if the eventual spread of "*-idēnus*" may in part be ascribed to analogical developments, the origin of the anomalous pattern itself should be sought in some feature related to the Sabellic material in question. Moreover, this feature should be attested early enough to account for the widespread appearance of *Salvidenus* and similar forms in Osco-Umbrian territory towards the end of the Republican period, and it should ideally be a feature connected in some way with onomastic usage.

4. A new approach, based on Paelignian ("North Oscan") orthography

One feature that is particularly germane to onomastic practice is orthography – and I suggest that an interesting solution emerges from consideration of the most striking peculiarity of native spelling in Paelignian, the neighboring North Oscan speech form that is directly to the south of Vestinian. The longest surviving text in Paelignian, the so-called "Herentas inscription",[23] is the epitaph of a priestess whose name (or perhaps priestly title plus name) could be rendered in Latinized form as "Prisma[24] Petiedia". The Paelignian orthography, however, makes use of a special symbol "Ð": as is generally acknowledged,[25] this variant of "D" was used to indicate a palatalized (whence possibly spirantized,

---

22 Cf. also the old praenomen *Fādus* (Virg. *A.* 9.344), on which see Schulze (1904, 516).

23 Pg 9 (Corfinium), 1st century BCE; see also *Imagines* I, 267-268 (Corfinium 6). On the text of Pg 9, see most recently (and with special attention to its layout and metrical structure) Mercado (2012, 319-327, 367, with earlier references).

24 I.e., Lat. *Prīma*.

25 See, e.g., Jiménez Zamudio (1986, 22-23).

assibilated, or affricated) pronunciation of [d] (arising from earlier *_dy_ sequences), such as [d^{y}], [ð^{y}], [z], [d^{z}], [ž] (among other possibilities) – hence <PETIEƉV> on the stone (given as *petieðu* in Rix's transcription).[26] This name is itself a formation in *-*idyo*- (here in its dissimilated form *-*edyo*-), as is a second instance of this spelling in the same individual's other name, <ỊVIBƉV> (Rix *ụibðu*) 'Vibidia' (with regular syncope of the medial vowel).[27] If we recall (n. 4 above) that the gentilicium "Salvidius" is actually attested in Paelignian (likewise, in fact, from Corfinium, though in a straight Latin-alphabet text), it becomes possible to consider the extended version Lat. SALVIDENVS in light of traditional Paelignian orthographic usage involving the symbol <Ɖ> (for "palatalized D" < *-*dy*-) and the surface phonetic behavior this notation implies. One can postulate, then, a hypothetical Paelignian spelling of the sort *<SALAVIƉENS> 'Salvidienus', in which the palatalization resulting from prevocalic *-*dy*- (which under this interpretation appears in a morphologically regular sequence *-*idyēno*-) is reflected in the special character <Ɖ>, exactly as in Pael. <PETIEƉV> (< *-*edyā* < *-*idyā*) and <ỊVIBƉV> (< *-*idyā*), whatever the precise phonetic value of this character may have been (whence, e.g., [salawīd^{y}ēns], [salawīd^{z}ēns], etc.). The version SALVIDENVS/SALVIDENA attested in Civita di Bagno (less than 60 km distant from Corfinium) would thus reflect a transfer of the native spelling practice to Latin, perhaps involving (as often) the maintenance of a traditional spelling in a family name.[28] It is even possible that the otherwise (one assumes) culturally "assimilated" Vestinian family in question retained a palatal (or palatalized, spirantized, etc.) pronunciation of what

---

[26] I have discussed elsewhere (1993, 290ff., with earlier references) the graphic practice itself, in comparison with similar techniques in non-urban Latin inscriptions that attempt to indicate a palatal or palatalized pronunciation for non-Latin (especially Sabellic) onomastic forms. The technique (attested as early as the 3rd and no later than the 1st century BCE) essentially involves the use of consonant letters with ligatured "I", oriented either horizontally (as in this case) or vertically. (There is no space here to consider possible connections of Paelignian "Ɖ", typological or otherwise, with the similar-looking "Tau Gallicum". My thanks to Joshua Katz and Oliver Simkin for pointing out to me the potential interest of that comparison.)

[27] The other two occurrences of "Ɖ" in the text of Pg 9 (both 3 sg. verb forms) are <AFƉED> (famously compared with Lucil. *afzet* [581 Marx] or *abzet* [Warmington 623, Terzaghi 617, Krenkel 583, Charpin XXII.5]) and <VIƉAD>. See on these forms Untermann (2000, 57-58 and 854).

[28] Given the relative frequency of the name in this general area (cf. n. 12 above), it is not especially problematic that *Salvidienus* (and not *Salvidenus*) happens to be attested in Corfinium itself in the late Republican period (*SupIt* 3, Corfinium #77: SALVIDIE[NVS]).

was now spelled, in the Latin context, as plain <D> (rather than the original <Ð>); and if so, this instance could be added to a number of others Dupraz has discussed, showing that "le latin régional était prononcé selon une phonétique osque", in which case "le substrat osque entraînerait des traitements spécifiques du latin du pays vestin" (2010, 473). But it is equally likely that in the Latin context, this pronunciation had been abandoned in favor of plain [d], given the absence of phonetically comparable intervocalic obstruents in Latin, and under the analogical pressure exerted by existing Latin names in *-idio-* and *-idiēno-,* with [d]. In either case, Lat. SALVIDENVS and SALVIDENA acquire new interest as forms pointing to an unusual type of cross-language interference in regional Latin: i.e., one with not only a phonetic but also possibly an orthographic component.

5. Implications for other alleged "truncated" forms

Dupraz has proposed a "truncation" (or "elision") analysis for the gentilicium OCRATIVS, found in the inscription *CIL* I^2 1807 (IX 3612) in his corpus of Latin material from Vestinian territory (= V 16 in Dupraz's numeration; 2010, 259-261).[29] According to Dupraz, "il s'agit d'une dérivation en **-yo-* sur un thème **okrāt-,* qui … comporte lui-même un suffixe **-āt-* sur la base **okri-,* élidée de son [i], du nom sabellique de la 'citadelle'" (2010, 260-261). The etymological interpretation is attractive, and seems likely to be correct: indeed, Schulze (1904, 201) had already compared Etr. *ucar, ucr-, ucur-,* which cannot be separated from the Sabellic word in question (U. **ukar**/*ocar*, etc.; Untermann 2000, 791ff.). As for the "elision", however, Dupraz astutely observes (2010, 261n2) that it finds support precisely in the nom. sg. of the Sabellic word in question, which underwent syncope of the final syllable, whence the Umbrian nom. sg. form just cited (**okris* > U. **ukar**, etc.). With this as a basis, then, one can say that there is no real morphological "truncation" as such (nor was this obligatory, as can be seen from existing ethnonyms in *-riāt-*):[30] rather, the formation in *-āt-* was based secondarily on the stem-form /okr-/, inferable by speakers on the basis of the syncopated nom. sg. and presumably also other forms of the paradigm (cf. U. acc. sg. *ocrem,* gen. sg. *ocrer,* SPi. loc. sg. **okreí**, etc.).

---

[29] A second occurrence of *Ocratius* in Dupraz's corpus appears in the fragmentary text V 19' (see Dupraz 2010, 510, with reference). For additional attestations, see Schulze (1904, 201).

[30] E.g., Lat. *Curiates,* U. **Kureiate** (dat. sg.) (Ernout 1965, 42); in non-Latin contexts, also *Caburriates* (Ligurian; Ernout 1965, 49), *Clauariati* (dat. sg.) and *Asseriates* (Celtic; Ernout 1965, 51-52), *Oseriates* (Pannonian; Ernout 1965, 53). The suffix in question is probably an *i*-stem; but following Dupraz's "**-āt-*" (as above), we will use informal notations like /-nāt-/ in what follows.

At first glance, real instances of "*y*-truncation" would seem to present themselves in several other cases involving the same suffix *-āt-,* frequent in Italic ethnonyms derived from toponyms (see in detail Ernout 1965; Heidermanns 1996, 219-220 [§§177-178], with references). The best attested of these apparent "truncated" forms involve toponyms in *-*nyā* or *-*nyo*- serving as the basis for ethnonyms in /-nāt-/, and not (as expected) /-niāt-/. Thus Meiser[31] cites Lat. *Mefanas,*[32] Etr. *Mefanate* (Clusium, Cortona) based on *Meuania,*[33] and Etr. *Felcinate* (Perusia)[34] beside *Fulginium.*[35] And it may be possible to add one or more items, such as *Solonates* beside *Solonius*/*-ium* (Ernout 1965, 47), or *Lauinates* beside *Lauinium* (Ernout 1965, 39), or O. **Lúvkanateís** beside *Lucania* (Heidermanns 1996, 219). Yet the situation is not so simple. Thus for *Lauinium*/*Lauinates,* note also Λαβινιατῶν for the ethnonym (D.H. V.61.3); and for the toponym istelf a variant *Lauinum* is also attested (Juv. 12.71), not to be separated from evidence for an adjective *Lauinus* (beside more frequent *Lauinius*): even if modern editors prefer to read trisyllabic *Lauinia* (with synizesis) at Virg. *A.* 1.2,[36] *Lauinis* at Prop. 2.34.64 is metrically secure, cf. also Fasti cap. triumph. a. u. c. 416 LAVINEIS. The situation with **Lúvkanateís** is similar: thus the derivational basis may involve a **Lūcāna,* cf. the adjective *Lūcānus* (Ernout 1965, 39). And for Umbro-Etruscan *Felcinate* (← *Fulginium*): we find also *Fulginiates* beside Lat. *Fulginates* (Ernout 1965, 43). Nor is /-niāt-/ otherwise excluded: cf. *Hercuniates* (← *Hercynia silua,* etc.; Ernout 1965, 53). One could also argue that the regular treatment of *-*nyo*- in such ethnonymic derivations is illustrated in *Samnītēs* (: *Samnium*),[37] again without "truncation". It seems possible to suppose, as a consequence of these considerations, that the pattern in *-*nyo*-/*-*nyā* → /-nāt-/ arose analogically, on the basis of the extremely frequent cases involving *-*no*-/*-*nā* → /-nāt-/,[38] aided by cases of the type *Lauinium*/*Lauinum* (adj. *Lauinius*/*Lauinus*), for which both variants are attested. Moreover, the produc-

---

31 (1986, 73-74), cited by Dupraz (in connection with *Ocratius*) at (2010, 261n4).

32 Cf. also Lat. *Meuanates* (Ernout 1965, 43).

33 "in der Derivation das *yā*-Suffix unterdrückt ist".

34 Cf. Fal. *Feleginas, -ates* (Ernout 1965, 38).

35 "mit Unterdrückung des *yo*-Suffixes".

36 So, e.g., Austin (1971, 29), while admitting that there is "good authority" in the manuscripts for both *Lauiniaque* and *Lauinaque*; *OLD* (s.v. *Lāuīnus*), in contrast, assumes the latter.

37 See the classic treatment by Rix (1957, 135ff.).

38 *Abellinus*/*-um* : *Abellinates, Antemna(e)* : *Antemnates, Aquinum* : *Aquinates, Arpinum* : *Arpinates, Atina* : *Atinates, Aufidena* : *Aufidenates, Casilinum* : *Casilinates, Casinum* : *Casinates, Fidenae* : *Fidenates,* and over two dozen more (see Ernout 1965). Cf. also the *n*-stem pattern *-*nōn*- → /-nāt-/: *Frusino, -onis* → *Frusinates* (Ernout 1965, 38).

tivity of the pattern in /-nāt-/ can be supported by the existence of a metanalyzed suffix variant *-nāt-* (instead of *-āt-*), as seen in formations like *Aletrinates* (: *Aletrium*), *Anxurnas* (: *Anxur*), *Tereuentinates* (: *Ter(e)uentum*), and a number of others.[39]

The only other form known to me that may show "*y*-truncation" is the **Cluvas,* pl. **Cluvates* taken to be implied by the gentilicium Lat. *Cluvatius*/*Clouatius* (O. **Kluvatiis**, **Kluvatiium**, **Kluvatiui**), cf. also **klowāto-* in O. **ḳḷuva[z]**, κλοϝατσ, κλοϝατηισ, beside a toponym *Cluviae* (Ernout 1965, 37). But here again (as with *Ocratius* above), one may appeal to a secondary stem "**Kluv-*" (cf. syncopated nom. sg. **Kluvis*) as the basis for such forms.

In short: the material in this section does not strongly support the existence of a process of "*y*-truncation" (or "*y*-elision", "*y*-suppression") as a regular procedure in the derivation of Italic onomastic forms; and given the probable secondary origin of Lat. *-idēnus* (as discussed above), it may be time to abandon, for such data, the concept of morphological "truncation" as an explanatory device – an irregular and unexpected pattern that we would be happy, after all, to do without.[40]

---

[39] Note also, as a special problem of this kind, the four feminine gentilicia in North Oscan territory identified by Dupraz (2009, 329ff.) as showing formations in **-nā* and **-rā* for expected **-nyā* and **-ryā,* i.e. with "dérivation zéro", showing "une absence de suffixe": *Ptruna* 'Petronia' (*CIL* I^2 3246 = Pg 52; Corfinium), *Pompona* 'Pomponia' (*CIL* I^2 3248; Corfinium), *Licina* 'Licinia' (*CIL* I^2 3257 = MV 7; Torre dei Passeri), *Vara* 'Varia' (*CIL* I^2 3260 = MV 6; Teate). Dupraz explains these forms on the basis of a secondary analogy to ambiguous gentilicia associated with "onomatopoetic" names of the type **Acca-, *Anna-, *Amma-, *Atta-*. The solution is ingenious, and may be correct; but I continue to think it possible that spellings of the type *Ptruna, Licina,* etc. simply show non-urban palatalizations (with <na> spelling [-n^{y}a] for [-nia]), even in the probable absence of ligatured N-forms in these texts (Vine 1993, 296-297; cf. n. 26 above), and despite the absence of consonant gemination (see on this point Dupraz 2009, 330n39), which need not have been a regular feature of the orthography of such texts. For <r> = [r^y] and <l> = [l^y]: cf. perhaps Lat. VEITURIS beside VITURIES (*CIL* I^2 584 [Sent. Minuc.]; Polcevera) and CAECILEIS 'Caecilieis' (*CIL* I^2 3004; Rome]) (Vine 1993, 235 with n. 59). Here also note *Suillates* (: *Suillius, Suellius*; Ernout 1965, 44), where the geminate <-ll-> may spell [-l^y-]; see, e.g., Leumann 1977, 141 and Dupraz (loc. cit. above) on *Aufilli(s)* 'Aufilius' (*AE* 1984.310, near Corfinium).

[40] With great pleasure, and not without some trepidation, I offer this *opusculum onomasticum* as a small token of friendship and admiration to José Luis García Ramón, a true modern master of Namenforschung, and of much else.
