Faliscan *foied*, Latin *hodiē* 'today', and Italic **d(i)i̯ē-*

BRENT VINE

1 Fal. *foied*, Lat. *hodiē* 'today' and Ital. **di̯ē-* vs. **diu̯ē-*

There is little disagreement about the basic make-up and background of Faliscan **foied**[1] and Latin *hodiē* 'today' (Pl.+), although questions remain about some of the details. Both words begin with a thematic pronominal element (**ho-* in Italic terms; we return to this form below) followed by a form of Ital. **d(i)i̯ē-* 'day' (apparently **-di̯ē-* in Faliscan, **-diu̯ē-* in Latin).[2] This *ē*-stem version of the word for 'day' developed from the Stang's-Law treatment of the acc. sg. of PIE **di̯éu̯s* 'god (of the daylit sky)',[3] specifically in its "Lindeman form," i.e. acc. sg. **diu̯ém* (cf. Ved. *diyám*) → new nom. sg. **diu̯ēs* (Lat. *diēs* 'day') and generalized stem **diu̯ē-* (abl. sg. OLat. DIED,[4] Class. Lat. *diē*, gen. pl. *diērum*, etc.).[5]

It is sometimes claimed[6] that Ital. *oqqi* 'today' continues a Lat. **hoi̯u̯ē* that shows a form in **-di̯ē-* comparable to Fal. **foied**. But this is entirely unnecessary: *oqqi* can reflect a standard development of Class. Lat. *hodiē* with the regular late Latin glide

[1] Middle Faliscan, in the famous pair of nearly identical texts on late 4th-century-BCE kylikes (Bakkum nos. 59–60, 2009:434–5): **foied.uino.pipafo.cra.carefo.** (no. 59) ~ **foied.uino.pafo.cra.carẹ[f]o.** (no. 60), 'Today I will drink wine, tomorrow I will be without'.

[2] More below on the question of the desinence of these forms. The initial /f-/ in the Faliscan form (for expected /h-/) is best interpreted as a hypercorrection (Bakkum 2009:79–83, with earlier references; Weiss 2011:476), cf. Fal. **he**, **hec** ~ **fe** 'here' = Lat. *hīc*, based on the same pronominal stem, among other such /h-/ ~ /f-/ forms.

[3] See Rau 2010 on the PIE-level morphological analysis of this word.

[4] *CIL* I² 2872.

[5] The Latin acc. sg. form *diem* (with /ĕ/), vis-à-vis its source form **diu̯ém*, shows the regular shortening of long vowels before final **-m* (Weiss 2011:125, 233). For the version of Lindeman's Law assumed here, see Fortson 2010:72. According to an alternative conception (as in Beekes 2011:139, *EDLIL* s.v. *diēs*), "Lindeman forms" are exclusively an Indic phenomenon, and the Italic stem **(-)diu̯ē-* shows a remodeling based on /di-/ of the old oblique stem, as in gen. sg. **diu̯-ós* etc. Those who subscribe to this view can readily substitute it when Italic "Lindeman forms" are referred to in what follows; the difference between these two approaches is not critical for the argument.

[6] Thus Sihler 1995:189.

formation in /diV/ sequences (> /di̯V),[7] cf. Lat. OZE (*CIL* VIII 8424; Mauretania, late 2nd c. CE), *ozie* (Isid. *Etym.* 20.9.4)[8] and Lat. *radius* 'ray' > Ital. *raggio*.[9]

Elsewhere in Italic, **(-)di̯ē-* (as in Latin) is well attested, but there is virtually no evidence for **(-)di̯ē-* (as in Faliscan). The Sabellic *ē*-forms meaning 'Jove' are almost exclusively based on **di̯i̯ē-* (with one exception to be noted below), as in U. voc. ***Di***, O. voc. **dí** (in **dípatír**) (< **di̯i̯ē*), U. acc. *Dei* (< **di̯i̯ēm*);[10] similarly, with a more complex formation based on a Sabellic word for 'day', Volsc. *Declune* dat. sg. 'to the Day-goddess' < **di̯i̯ē-kelo-* 'day'[11] + "goddess suffix" *-ōnā*. Sab. **di̯i̯ē-kelo-* 'day'[12] appears as such in U. **tiçel** 'day',[13] but has been adjusted to **di̯o-kelo-* (after diphthongal **di̯ou̯-* forms)[14] in O. **iúkleí** loc. sg. 'day'.

It is often assumed[15] that a form **di̯ē-kelo-* is attested in O. (Bantia) *zicolom* 'day' (also *ziculud*, *zicolois*, *zicel*[*ei*]) and **iíkúlús** nom. pl. 'days',[16] but this is in fact far from clear. The essence of the problem is that anaptyxis in Oscan does not occur after long vowel, diphthong, or other heavy syllable: thus **fíísnú** 'shrine', **fuutreí** 'daughter', *contrud* 'against' (Bantia), etc., all without anaptyxis. Therefore **di̯ē-kelo-* > **di̯ē-klo-* (with regular syncope) > O. *zicolo-* and **iíkúlús** (with anaptyxis) constitutes the sole exception to this otherwise robust pattern.[17] Despite the tortured attempt by Buck to justify the anaptyxis (1928:52 n. 1), it was already clear to Thurneysen and Bréal in the 19th century[18] that O. *zicolo-* requires a preform with short vowel preceding the suffix. In the most detailed analysis of the question, Rix (2004:496–7) begins from the observation that **di̯ē-kelo-* itself is nowhere directly found, but rather to be reconstructed on the basis of existing evidence. This includes the forms listed above as pointing to **di̯i̯ē-kelo-* (Volsc. *Declune*, U. **tiçel**), as well as the form **di̯o-kelo-* (remodeled after diphthongal **di̯ou̯-* forms) in O. **iúkleí**. For O. *zicolo-* and **[d²]iíkúlús**,

[7] See Rohlfs 1966:390; Väänänen 1981:46–7, 53–5.

[8] Leumann 1977:11, 130; Weiss 2011:513 n. 57.

[9] Ital. *medio* is a secondarily Latinized form (Rohlfs 1966:391).

[10] Cf. Lat. *Diēspiter* (Pl.+) and early inscriptional DIESPTR (*CIL* I² 564, Praen.), [D]IESPATER (*CIL* I² 568, Praen.).

[11] Cf. Lat. *diēcula* 'one little day, short space of a day' (Pl.+). On the gender of this form (vs. the masculine in Sabellic), see Rix 2004:494 n. 13.

[12] On this word see especially Rix 2004:496–7 and also Meiser 1986:160, Heidermanns 1996:211 (with further references), Untermann 2000:868–9, Tikkanen 2011:43–4.

[13] To be distinguished from **²tiçel** 'specifying formula'. On **¹tiçel** vs. **²tiçel**, see Weiss 2010:200–17.

[14] As in Sabellic 'Jove' forms, e.g. O. gen. **iúveís**, dat. **iúveí** (U. **iuve**). There may also have been diphthongal 'day' forms, to judge from Lat. *dius* 'by day' < gen. **diu̯-ós*, cf. *-duum* (e.g. *būduum* 'period of two days') < (renewed) acc. **-diu̯-om*, loc. **di̯i̯éu̯* (Lindeman form) > Lat. *diū* 'by day'. For many additional details concerning the Italic 'day' forms, see especially Nussbaum 1999 and Rix 2004, as well as Nishimura 2016 on the adverbial forms.

[15] See the references in n. 12 above.

[16] *ST* Fr 14 = *ImIt* Histonium 2 (ca. 125 BCE). The reading is not entirely clear: *ImIt* prefers **[d]iíkúlús**, but grants that **iíkúlús** "is equally possible"; Rix saw no **[d]** (Untermann 2000:868, Rix 2004:497 n. 25).

[17] I am extremely grateful to Nicholas Zair for helpful discussion of the material in this paragraph, in part based on his current research on Oscan anaptyxis (cf. Zair 2018).

[18] See Untermann 2000:868 for references and discussion.

then, Rix posits a "Kompromissstamm" **dii̯-kelo-*,[19] and assumes that the attested **dii̯ē-kelo-*, **di̯o-kelo-*, and **dii̯-kelo-* must all reflect analogical developments based on an original **di̯ē-kelo-*. But this may not be the only possible conclusion to be drawn from the data, and the last word on the subject has perhaps not been said. It seems possible, for example, that the historically basic form is **dii̯ē-kelo-*, with **di̯o-kelo-* an evident remodeling based on **di̯ou̯-* forms (as Rix thought), but with **dii̯-kelo-* (standing for "**di̯ē-kelo-*", cf. n. 20) a "Kompromissstamm" based on both **dii̯ē-kelo-* and **di̯o-kelo-*. Nevertheless, it will be sufficient for present purposes to note that under Rix's analysis, O. *zicolo-* and **[d^{z}]iíkúlús** constitute the sole—and very indirect—evidence for an actual stem-form **di̯ē-* in the extant Sabellic corpus. (We will return to the problem below, in §4.)

The only other possible evidence for a Sabellic form of the 'Jove'/'day' word based on a stem **di̯ē-* is not actually found in Sabellic as such, but may occur in Messapic *zis* 'Zeus' (nom. or voc.):[20] according to a suggestion of Rix (2004:492, 495), the word could be borrowed from a "Southeast Oscan" form [d^{z}īs] or the like < **di̯ēs*, cf. above on forms like U. voc. *Di* (< **dii̯ē*), acc. *Dei* (< **dii̯ēm*). We will return to the Messapic form in §6. Finally, in this connection, Ven. **tiie.i.**[21] probably does reflect a surface realization [di̯ēi̯] or [di̯ei̯]; but this could in principle result from a secondary loss of syllabicity based on an original locative like **dii̯ēi̯* (cf. Prósper 2018b:59–60 n. 13). Given various uncertainties about Venetic orthography and phonology (which need not be rehearsed here), this form, which will also return briefly in §6, can bear very little weight in the discussion.[22]

It thus emerges that the **-di̯ē-* of Fal. **foied** is almost entirely isolated, as opposed to the **-dii̯ē-* otherwise found in Italic. What accounts for this **-di̯ē-*? The question is almost never addressed explicitly, apart from handbook assertions that Lat. *hodiē* has a "restored" *-d-* (based on *diēs* 'day'), implying that Faliscan shows an older or more original version of the *ē*-stem in question.[23] Support for that position is sometimes offered by asserting an inherited status for the Faliscan/Latin 'today' word, a claim to be assessed in the next section.

[19] Or rather, strictly speaking, **dii̯̯-kelo-*, with a presuffixal vowel that Rix takes to be "das kurze Pendant zu /e̯/" (2004:497 n. 24).

[20] The case assignment depends on the analysis of the accompanying verb *kl(a)ohi* (in the fixed phrase *kl(a)ohi zis*), which is normally taken as either imperative 'hear!' (e.g. a 2sg. "*si*-imperative," see Jasanoff 1987:105–6; thus voc.) or as a 3sg. optative 'may he hear' based on the *s*-aorist stem (Matzinger 2005:42; thus nom.); and as a variant of these, note Peters 2006:347 (*kl(a)ohi* as subjunctive or optative of an acrostatic *s*-present). (My thanks to Ron Kim for bringing the Peters article to my attention.) An entirely different account of the phrase will be mentioned below, in §6.

[21] In the sequence **tekome.i.tiie.i.** in the "Tavola da Este" (Marinetti 1999:413–23), plausibly interpreted by Marinetti (1999:420) as 'on the 10th day'; so also, more recently, Prósper 2018a:469 and Martzloff 2018:105–6.

[22] I am very grateful to Blanca María Prósper for expert guidance on the analysis of this Venetic form.

[23] See e.g. Leumann 1977:126, Sihler 1995:189, van der Staaij 1995:45.

2 The Faliscan/Latin 'today' words as inherited

According to Leumann (1977:126), Fal. **foied** and Lat. *hodiē* continue "ein umgestaltetes Erbwort (vgl. ai. *adyá* 'heute')." This is an old idea,[24] but one that is difficult to accept:[25] to begin with, there is no actual correspondence with Ved. *adyá* beyond the sequence *-*di̯-* (which, as we have seen, appears descriptively in Faliscan and Venetic only). For the first element, the anaphoric pronoun stem *$(h_1)e$- of *adyá* is not only a different entity, as compared to the *g^ho- of Italic, but one that displays different behavior: whereas *$(h_1)e$- is sometimes found in the guise of a first compound member,[26] this behavior is not found with *g^ho-.[27] Secondly, whatever the background of Ved. *-á* ∼ *-ā́* (in *adyá* ∼ *adyā́*),[28] Fal./Lat. *-*d(i)i̯ē-* is hard to separate from the Italic stem *dii̯ē- 'day', which (as we have seen) is ultimately a secondary development within Italic based on the Stang's-Law treatment of the old acc. sg. *di̯éu̯-m*, as opposed to unextended *d(e)i̯- in *adyá* ∼ *adyā́*.

An updated version of the claim about inherited status is offered by Dunkel (*LIPP* 2.140–1, 326). In this conception, Ved. *adyā́* (but not *adyá*) and Fal. **foied**/Lat. *hodiē* derive from a sequence *h_2o *di̯ éh*$_1$, consisting of the following three elements:

i. Ved. *a-* < 1. *h_2o* 'neben, bei; zu – hin' (*LIPP* 2.323–34); Ital. *oi̯i̯ē* was then remodeled to *hoi̯i̯ē* (with Fal. **fo**-/Lat. *ho-*) after the *ho-* of the near-deictic pronominal stem *g^ho-;

ii. *di̯* = a particle *dí* 'hell; am Tag, tages-' (*LIPP* 2.139–44); the medial *-d-* was restored in Latin (as above, §1 ad fin. with n. 23);

iii. a postpositive "wort-emphatisch" particle *éh*$_1$ following the preceding, whence *di̯ éh*$_1$ '(es ist) sehr hell' (*LIPP* 2.140; 2.208–20 on *éh*$_1$, especially 212–4 on relevant postpositive behavior).

This approach seems equally problematic:

Ad (i): The remodeling of Ital. *oi̯i̯ē* to *hoi̯i̯ē* (as if with first compound member *ho-*) is not credible: since the particle *h_2o* in question had no interpretable synchronic profile in Italic,[29] it seems highly improbable that speakers would have been able to place a sufficiently clear interpretation on a sequence /oi̯i̯ē/—already rendered opaque in its 'day' part by the *-*di̯-* > /-i̯i̯-/ process—so as to remodel the form with demonstrative *ho-*, which (as already noted) does not actually participate in compounding (as opposed to univerbation, on which more below).

[24] For earlier references, see *LEW* s.v. *hodiē*, *EWAia* 1.65 s.v. *adyá*.

[25] Some of the points that follow recapitulate the cogent negative evaluation in *LEW* s.v. *hodiē*.

[26] Especially preceding deictic and demonstrative material: thus O. *etanto*, U. **etantu** 'so much'; Russ. *ètot* 'this, that'; Arm. *et'e* (complementizer). See *LIPP* 2.179 on this behavior of the "anaphoric particle **é*."

[27] *LIPP* 2.275–6, 277–9. The apparent exceptions Lat. *hōrnō* and *hōrsum* are treated below.

[28] Traditionally interpreted as sandhi variants (*EWAia* 1.65 s.v.: "rhythmische Sandhivariante"), perhaps involving an original laryngeal-final form (most likely instr. sg.) and its "Kuiper's-Law" outcome (Rau 2010:314).

[29] At best, this particle might have occurred as a frozen and quite opaque element of a few forms like *ōvum* 'egg', *ōcior* 'more swift' (cf. *LIPP* 2.323–34, s.v. 1. *h_2o*).

Ad (ii) and (iiii): Formally, Dunkel's particle **di̯* is equivalent to the (zero-grade alternant of the) more traditional root noun **dei̯/*di-*, as seen in Ved. *adyá* and other forms; but once again, this conception (together with the assumption of a following particle **-eh*$_1$) forces the unattractive separation of Fal./Lat. **-d(i)i̯ē-* (in 'today') from Ital. **diu̯ē-* 'day'. Moreover, this analysis forces the equally unattractive separation of Ved. *adyā́* from *adyá*.[30]

There is thus no serious basis for interpreting Fal. **foied** and Lat. *hodiē* as continuators of an inherited expression that incorporated (like Ved. *adyá*) a medial sequence **-di̯-*. With regard, then, to the contrast between **-di̯ē-* in Faliscan and **-diu̯ē-* in Latin, there is no good reason to take the Faliscan form as more archaic in this respect; and in fact, given the scant evidence elsewhere in Italic for **(-)di̯ē-* (as opposed to **(-)diu̯ē-*)—indeed, apart from the Messapic theonym *zis*, Ven. **tiie.i.**, and the uncertain testimony of O. *zicolo-* and **[d̓]iíkúlús**, the *absence* of such evidence in words for 'day'—it is rather the **-di̯ē-* of Faliscan that is more likely innovatory. In that case, it is worth considering how such a form might best be explained.

3 Faliscan *fo-*, Latin *ho-*, and univerbation

As already indicated, the first element of the Faliscan and Latin words for 'today' consists of some form of the near-deictic pronominal stem **ǵ^{h}o-* (> Lat. *hic* 'this', cf. Fal. **he(c)**, **fe** 'here'), as universally agreed. But as already mentioned (§2), this form has no support as an actual first compound member, which means that these words for 'today' are not in fact "compounds" (in the ordinary sense of that term), but rather reflect univerbation. There are, to be sure, other words that descriptively appear to show **ǵ^{h}o-* as the first member of a compound, i.e. Lat. *hōrnō* adv. 'this year' (Pl.+)[31] and *hōrsum* 'in this direction' (Pl., Ter.). But these, too, probably also reflect original univerbations rather than compounds.[32]

This is not a new conception for Fal. **foied** and Lat. *hodiē*, although (as we will see) the consequences of the univerbated structure have not in my view been sufficiently appreciated. For the sake of completeness (and since it will become useful, though not essential, for what follows), I provide the two most widespread proposals[33] about the case form of **ǵ^{h}o-* in the original two-part phrase for 'today' (< **'on this day'):[34]

[30] In Dunkel's conception, *adyá* is formed with a "modal" adverbial marker **-a* (*LIPP* 1.110–15, cf. Gk. *ἀλλά*, *διά*, *ἕνεκα*, etc.).

[31] Secondarily adjectivized: cf. *hōrnus* 'this year's' (Hor.+).

[32] For details, see *LIPP* 2.285, *EDLIL* s.v. *hōrnus*. (*hōrsum* is absent from *EDLIL*.)

[33] See e.g. *EDLIL* s.v. *hodiē*.

[34] Cf. univerbated '(on-)this-day' sequences (> 'today') like OCS *dĭnĭ-sĭ* (and, with a different order and case form, Russ. *sego-dnja*), Att. *τήμερον*, NHG *heute* (OHG *hiutu* < *hiu tagu*), vs. two-part expressions ('[on] this day') like Hitt. *keti* UD-*ti* [*šiwatti*], Go. *himma daga*.

i. loc. *$g^{h}oi̯$ (cf. HOI 'here', *CIL* I² 2658; Tibur Pedestal Inscription, ca. 500 BCE);[35]

ii. abl. *$g^{h}ōd$[36] (with "Kürzung durch Tonanschluss" at least in *hŏdiē*).[37]

4 Consequences for the evaluation of Fal. *foied* and Lat. *hodiē*

We can now return to the basic question about what accounts for the reduction of *-*di̯ē-* to *-*di̯ē-* in Fal. **foied**. This can be conceived of in more than one way:

i. In Rix's assessment of O. *zicolo-* and **[d²]iíkúlús** (in his opinion implying an earlier **di̯ē-kelo-*) vis-à-vis theonyms like U. voc. *Di* (< **di̯ē*), acc. *Dei* (< **di̯ēm*), etc. (cf. §1), he observed (2004:496) that "Die längere Wortstruktur hat also die phonetisch kürzere Variante der Basis selegiert, während die kürzere Wortstruktur des Göttternamens die phonetisch längere Variante **dijē-* benutzt." This is an interesting attempt to account for a type of variation that, if it really existed, would have been similar to the one observed in Fal. **foied** as opposed to Lat. *hodiē*, and which otherwise has received no attention even by those who likewise take O. *zicolo-* and **[d²]iíkúlús** to derive from a form **di̯ē-kelo-*.[38] Although Rix did not pursue the matter, one could paraphrase this idea by saying that Italic (or at least Sabellic) may display an analog of "Lindeman's Law": unsuffixed forms pointing to a stem **di̯ē-* exhibit the "Lindeman variant" (originally generated in monosyllabic forms), while the "longer variant" **di̯ē-kelo-* maintains the original structure with postconsonantal glide, essentially like standard examples of the sort Ved. *d(i)yaús* 'sky, heaven' vs. *dyā́vā-pr̥thivī́* 'heaven and earth', *ś(u)vā́* 'dog' vs. *śvá-yātu-* 'dog-sorcerer', *d(u)vā́* '2' vs. *dvādaśá-* and *dvā́daśan-* '12-',[39] Gk. δύω '2' vs. δ(ϝ)ώδεκα '12'.[40] This would be preferable to what seems to be the assumption of the handbooks, namely that O. *zicolo-* and **[d²]iíkúlús** (if based on **di̯ē-kelo-*) and Fal. **foied** (with **-di̯ē-*) just happen to preserve the "non-Lindeman variant" of the word, for some unknown (or at least unexplained) reason.[41] But there are two reservations that weaken this approach. One is that, as already discussed (§1), O. *zicolo-* and

[35] E.g. Meiser 1998:10, 78 (with the further assumption that the loc. sg. of 'day', i.e. **d(i)i̯ēi̯*, was replaced by the ablative).

[36] E.g. Leumann 1977:110, Bakkum 2009:435.

[37] The vowel length of the ⟨o⟩ in Fal. **foied** is of course indeterminate. For "Kürzung durch Tonanschluss" (thus univerbated **hō(d)di̯ēd* > *hŏdiē*, as in forms like *tŭquidem* 'you indeed', *sĭquidem* 'if indeed', etc., for *tū quidem*, *sī quidem*, etc., and especially the lexicalized form *quasĭ* 'as if' < **quam sei* for expected †*quāsī*), see especially Vollmer 1917, Leumann 1977:110–11, Meiser 1998:78, Weiss 2011:128, Questa 2007:153–71.

[38] The matter is unfortunately obscured by ambiguous notations like "**di̯ē-kelo-*" (Poccetti 2016:582, 585).

[39] Also analogical *duvā́daśan-*.

[40] δώδεκα (27× Hom.), but also analogical δυώδεκα (8× Hom.). For these and other examples, see Lindeman 1965:69–7. Barber (2012, 2013:48) offers a revisionist approach to "Lindeman's Law" (mostly addressing the Vedic evidence), but does nothing to overturn the basic patterns described here.

[41] Cf. e.g. *EDLIL* s.v. *diēs*, with a purely descriptive statement: "Oscan **djē-kelo-* shows the monosyllabic variant of the stem."

[d̥]iíkúlús do not straightforwardly continue a form **di̯ē-kelo-*. Moreover, as discussed in §3, the Faliscan and Latin words for 'today' are not actual "compounds" (as in the classic Lindeman material), and they are not even forms like **di̯ē-kelo-* (where the additional word length is due to a secondary suffix), but rather reflect univerbations of original two-word sequences ('on this day' → 'today'). This suggests that it would be more appropriate to consider the problem from the perspective of univerbation.

ii. One of the most common hallmarks of univerbation typologically is that it creates conditions favorable to phonological reduction; and a frequent type of reduction in such circumstances consists of medial syncope. This is documentable not just in Latin, but actually in one of the many univerbated sequences containing *diēs* 'day', i.e. *cottīdiē* 'daily' < **k*^{w}*otitei̯-di̯ei̯*.[42] Thus, whatever case form one chooses for the first member of the 'today' words, and however one conceives of the development of the word-final desinence (cf. §3), one can readily imagine an original univerbated sequence with second member **-di̯ei̯ē-* undergoing syncope, whence **-di̯ē-*. Note further that the first syllable of the univerbated sequence will have been monosyllabic (loc. **hoi̯* or abl. **hōd*). For the period in which the univerbation will have taken place (see further below), one must assume either word-initial accent (under standard assumptions about prehistoric accent in Italic)[43] or else, as I have argued elsewhere (Vine 2006, 2012), a phase with traces of PIE mobile accent. But this has little bearing on the phonological development: under the likely assumption that the univerbation removed the accent on the second element (e.g. for the loc. sg. option, */hói̯ dí̯ēi̯/ or */hói̯ di̯ēi̯/ > */hói̯-di̯ēi̯/, in the first instance), the salient point is that the operation of medial syncope, for a univerbated sequence, is essentially a matter of predictable phonological regularity for Italic.[44] A final issue for Faliscan concerns the chronology of the **-di̯ei̯ē-* > **-di̯ē-* reduction: if Faliscan mirrors Latin in this respect, and given the outcome **foied**, this must have occurred before **-di̯-* > **-i̯i̯-*, a change that itself is sometimes thought to be "of Proto-Italic date",[45] and is in any event very early, as it precedes PIE **d*^{h} > Lat. *d* (cf. Lat. *medius* '[in the] middle' < **med*^{h}*i̯o-*).[46]

The above considerations have consequences for the analysis of Lat. *hodiē*. In theory, since the reductions brought about by univerbation are not strictly rule-

[42] Opfermann 2016:77–104; for this particular sequence, one could also, of course, conceive of the syllabic reduction as "haplology." See Opfermann passim on univerbated *hodiē*, as well as *merīdiē* 'at midday', *perendiē* 'on the day after tomorrow', *prīdiē* 'on the day before', and (also with syncope) *postrīdiē* 'on the following day' (< **posterī diē*).

[43] See e.g. Leumann 1977:246–7.

[44] Early syncope in Latin, conditioned by initial accent, hardly requires documentation or reference; see Bakkum 2009:100–3 on syncope and initial accent in Faliscan.

[45] So van der Staaij 1995:45, 60.

[46] See Weiss 2011:159 on this chronology.

governed, the original *-*di̯ē*- (in the univerbated sequence) might *not* have undergone the same phonological reduction as in Faliscan, and thus could continue intact the more archaic form *-*di̯ē*-. If the original sequence involved the ablative singular (instead of locative singular), this could be understood straightforwardly as follows: for univerbated */hŏd-di̯ēd/ the form could have undergone a double reduction in Faliscan (i.e. degemination of *-dd-* and medial syncope), whereas Latin only applied degemination,[47] yielding */hŏ-di̯ēd/, the input for the operation of "shortening through enclisis" (§3 (ii) with n. 37), whence *hodiē*. In recent years, however, the classic controversy about the linguistic status of Faliscan has tended to favor the position that Faliscan was merely a dialect of Latin;[48] thus on balance, it seems preferable to assume that in the word for 'today'—formed, as we have seen, at a very early period—Faliscan and Latin underwent a unitary development, involving medial syncope of *-*di̯ē*- to *-*di̯ē*- consequent on the univerbation. In that case, Lat. *hodiē* would indeed reflect a secondary adjustment (of a presumed **ho-di̯ē* or **hō-di̯ēd*, etc.) after *diēs*, as the handbooks have it, though with a different starting point and in a more complex sequence of events than the traditional conception.

5 Concluding remarks on Ital. **di̯ē-* 'day'

If, as discussed above, neither O. *zicolo-* (and related forms in Oscan) nor Fal. **foied** actually continues a sequence **(-)di̯ē-*, the development of the word for 'day' in Italic (including the use of this stem in associated theonyms) becomes simpler: there is good evidence, in other words, only for **(-)di̯ē-*, ultimately based on the "Lindeman form" acc. sg. **(-)di̯ēm*.[49] This is, I submit, a welcome adjustment, and one that is preferable, as I have argued, to a situation in which very rare stray **(-)di̯ē-* forms have been preserved for no apparent reason. This conception aligns with that of Nussbaum (1999), according to whom the development **di̯ēm* → **di̯ēs* was Common Italic, followed by very early differentiation of **di̯ē-* 'day' (surviving in 'Jove' forms only in nom., voc., and acc.) and **d(i)i̯eu̯-* 'Jove' (with the meaning 'day' only in marginalized adverbial forms or frozen archaisms, and these apparently only in the Lindeman variant **di̯eu̯-*).[50] Nor, to my knowledge, is there any other good evidence for the maintenance of parallel Lindeman variants in Italic, apart from the diphthongal forms of 'Jove' and 'day' (i.e. **di̯eu̯-* ~ **di̯eu̯-*). Thus for the reflexive pronominal adjective, Italic inherited both monosyllabic **su̯o-* (e.g. OLat. *sīs* [Enn., Lucr.]; cf. Ved. *svá-*, Hom. (ϝ)ὅς) and the better-attested disyllabic **seu̯o-* (OLat. sovo-, O. **sú-**

[47] For degemination, cf. *cottīdiē* 'daily' → adj. *cottīdiānus*, but later (with degemination) *cotīdiānus* (Martial+).

[48] So Bakkum (2009:341–60), in an extended treatment (with voluminous earlier references).

[49] Or, in the alternative conception (cf. n. 5), the form of the word with analogically introduced /di-/ from oblique **diu̯-*.

[50] Lat. *nudius tertius* 'day before yesterday' (< *'now [is] the third day'), *diū* (and *interdiū*) 'by day'. This distribution argues against the idea that the **(-)di̯ē-* of Faliscan is somehow based analogically on diphthongal 'day' forms.

vad, SPic. **súais**; cf. Hom. *ἑ(ϝ)ός*); but there is also descriptively **suu̯o-* in Lat. *suus*. According to Petit (1999:212), **suu̯o-* is a Lindeman variant of **su̯o-*; but this is hardly compelling: it seems preferable to operate with the traditional conception of a reduction of /sou̯o-/ in unaccented position,[51] since this process accounts for a series of other forms as well, such as *dēnuō* 'anew' (< *dē novō*) and verbs like *fluō* 'flow' (generalizing the weakening treatment consequent on prefixed forms),[52] *duim* 'give',[53] and others.

6 Once again Venetic *tiie.i.* and Messapic *zis*

This leaves, then, Ven. **tiie.i.** and Messapic *zis* as the only forms that would seem to provide evidence for an Italic stem **di̯ēi̯-*.

The uncertain status of the Venetic form has already been noted, including the possibility that Venetic inherited a stem **diii̯ēi̯-* comparable to that in Lat. *diēs* (§1 ad fin.). If so, one could speculate—among various scenarios that could be entertained—that a univerbated word for 'today' similar to Fal. **foied** led to a stem **-di̯ēi̯-* (with syllabic reduction, as suggested above for Faliscan), and that this stem was generalized to all forms of 'day'.

As for Messapic *zis*, assuming the correctness of Rix's claim about the South Oscan provenance of the word (§1): it hardly needs to be said that much about Messapic remains unclear, and this word is no exception. It has traditionally been taken to be an inherited form, reflecting, to be sure, a PIE **di̯ēs*.[54] There is also, as I discuss elsewhere (2017:774–5), an entirely different etymological (and interpretive) proposal by Dunkel,[55] involving a near-deictic particle **ĥi-s*: thus *klaohi zis* = 'Listen here!', cf. Hom. *κέκλυθι* 'id.' (with a similar structure).

Yet even if Rix's contention about the word is correct—and it is undeniably attractive in some respects[56]—it need not be fatal for most of what was argued above. Taken at face value, the form could reflect a vanishingly rare trace in Italic of the non-Lindeman stem **di̯ēi̯-* (theoretically possible also for Ven. **tiie.i.**) that arose secondarily from acc. **di̯ḗm* (cf. Ved. *dyā́m*, Gk. **Ζ**ῆ*ν*)[57] in the same way that **diii̯ēi̯-* arose from the Lindeman form **diii̯ḗm*. Significantly, the Messapic word does not mean 'day', and would thus not undermine the basic idea (§5) concerning the early gen-

[51] See in detail Leumann 1977:135.

[52] Cf. archaizing OLat. CONFLOVONT (Sent. Minuc., *CIL* I² 584.23).

[53] Often prefixed: e.g. OLat. *perduim* (Pl.+), *produit* 'porro dederit' (F. 254.16L), CEDVES and CEDVAS (*CIL* I² 2841, 3rd c. BCE); unweakened /dou̯-/ in Fal. **douiad**, U. **purtuvitu**.

[54] So *MLM* 2.155 s.v., with earlier references. I forgo a discussion of the complex problems related to the treatments of PIE **di̯* and **ē* in Messapic.

[55] Dunkel 2004:47, *LIPP* 2.402 n. 17.

[56] It has even been suggested (Pisani 1972:114, with earlier reference) that South Oscan palatalizations (most prominent in Bantine Oscan, including *z-* < **di̯-*) are an areal feature imported from Messapic.

[57] And perhaps Arm. *erkin* 'heaven' (Klein 2017:378–9).

eralization of **di̯ēi̯-* in Italic in words for 'day', and the resulting conception of Fal. **foied** as ultimately reflecting **di̯ēi̯-* and not (as usually thought) **di̯ē-*.

But one could also propose scenarios whereby a South Oscan source form in **di̯ēi̯-* could have led secondarily to Messapic *zis*. These would all be purely speculative, so only one such suggestion need be offered here, for illustrative purposes. Messapic *zis* could have been generalized from the first member of a two-part expression (Ital.) **di̯ēs-patēr*, like OLat. *Diēspiter* and similar to the **di̯ēi̯-patēr* (with voc. **di̯ēi̯*) in O. **díi patír** (§1).[58] Even though univerbated **di̯ēs-patēr* did not happen to undergo phonological reduction elsewhere in Italic,[59] as far as can be seen from the attested forms, this could have happened in the South Oscan source form underlying Messapic *zis*, perhaps as the result of an accent shift to the second syllable, i.e. **di̯ḗs-patēr* (with initial stress) > **di̯i̯ḗs-patēr*, whence (with reduction) **di̯ḗs-patēr*, the source of the Italic **di̯ḗs* reflected in Messapic *zis*. The accent shift, in turn, can be supported to some extent by the similar phenomenon documented for Umbrian, where some medial "Pleneschreibungen" may indicate secondary lengthening and/or accentuation under certain circumstances, e.g. preceding "heavy" suffixes (such as **-klo-*) or preceding an enclitic.[60] In theory, a disyllabic second member **-patēr* of a univerbated sequence could qualify as both a "heavy suffix" and an enclitic. Thus, without intending to argue strongly for this particular method of generating Messapic *zis* secondarily from a South Oscan basis in a stem **di̯ēi̯-*, I think it reasonable to conclude that the Messapic form, like Ven. **tiie.i.**, does not pose a serious obstacle to the claims presented here about early Italic **di̯ēi̯-* 'day' and the presence of this form in both Fal. **foied** and Lat. *hodiē*.[61]

[58] Recall that, as surveyed in §1, Italic preserves nom., voc., and acc. *ē*-forms for 'Jove' only in the form **di̯ēi̯(-)*, never †**di̯ē(-)*.

[59] Apart from the regular vowel weakening seen in Lat. *Diēspiter* and (possibly) inscriptional DIESPTR (n. 10), depending on the interpretation of that form (Vine 1993:329, 340).

[60] For the phenomenon, see Meiser 1986:141–2, 145–6, with examples; e.g., before heavy suffix: **mantrahklu** 'hand towel (vel sim.)' (with Pleneschreibung, also spelled **mantraklu**, *mandraclo*); before enclitic: *seipodruhpei* 'on both sides'. As Meiser points out, moreover, secondary accentuation preceding an enclitic has good typological parallels in both Latin and Avestan.

[61] This is a revised version of material presented at the 36th East Coast Indo-European Conference (Cornell University, 1–4 June 2017) and before students and faculty of the UCLA Program in Indo-European Studies; warm thanks to both audiences for their helpful comments, and also to Benjamin Niedzielski (UCLA) for skilled research assistance. It is a special pleasure to be able to include this paper, as a small token in recognition of longstanding friendship and collaboration, in a volume honoring Kazu Yoshida, who truly embodies that old characterization "a gentleman and a scholar."
