aber dass sie in dieser Form in nachmykenischer Zeit gebildet wurde, ist so gut wie ausgeschlossen, sogar im (sehr unwahrscheinlichen) Fall, dass das femininisierte Hinterglied als ganzes aus einem anderen, älteren Namen übernommen worden sein sollte. Zwar wurde der Ersatz von -φαττα durch -φόνεια und -φόνη erst akut, nachdem die Labiovelare sich zu Dentalen und Labialen entwickelt hatten, also in nachmykenischer Zeit, doch muss dieser Ersatz wegen der nun eingetretenen Verwechselbarkeit der Wurzel sehr bald nach 1200 v. Chr. vorgenommen worden sein, nämlich spätestens im 11. Jh., da die Veränderung der Labiovelare vor dem ion. Wandel ᾱ [a:] > η [e:] anzusetzen ist[42]. Und da anzunehmen ist, dass bei derselben Umgestaltung gleich auch das Vorderglied verändert wurde, muss der Name so lange vor dieser Zeit gebildet worden sein, dass inzwischen das Wort *περσο- vollkommen ausser Gebrauch geraten und unverständlich werden konnte. Damit kommen wir für Περσόφαττα mit an Sicherheit grenzender Wahrscheinlichkeit in mykenische Zeit hinauf. Wir warten also auf eine myk. Form **pe-so-qo-sa.*[43]

Der vierte Band des LfgrE wird in drei Faszikeln etwa im Format von Lief. 20 (Lief. 21 ῥά-τελεσφόρος 2006, Lief. 22 τελευτή – φεύγω 2008, Lief. 23 φή – ϡΩψ 2010) zu Ende gebracht werden. Für 2010 ist ein Abschlusskolloquium geplant. Rez. gratuliert der ganzen Equipe und ihrem Redaktor und wünscht allen, insbesondere den ‚Senioren' R. Führer, M. Schmidt und V. Langholf, die einen grossen Teil ihres verdienten Ruhestandes weiterhin dem Projekt widmen, für den letzten Band viel Schaffenskraft und Freude.

The nature and origin of Homeric language have recently been illuminated by two books, one (Haug) a published version of a doctoral dissertation (dedicated to the memory of Haug's principal advisor, Nils Berg), the other a revised version of Hackstein's Habilitationsschrift. These are rich and stimulating studies – yet, despite interesting convergences, they differ markedly in both style and substance.

Haug's essay displays the virtues (and some of the shortcomings) typical of Francophone classics in the field. Exposition and argumentation are lucid and elegant, and citation of data and bibliography is kept to a minimum – a refreshing contrast to the hyper-annotated style common in much German-language research, and occasionally on view in Hackstein's study. Yet the strength of Haug's case ultimately rests on the careful sifting of points of detail, for which one sometimes wishes Haug had opted for the less parsimonious analytical approach that constitutes one of the strengths of Hackstein's treatment.

As their titles indicate, these books differ fundamentally in their orientation toward the problem of Homeric language. Haug's interest in exploring alleged Achaean and Aeolic elements in their relationship to the Ionic features of epic language is essentially diachronic. The heart of the book consists of three chapters, one for each of these dialects: "L'élément achéen dans la langue épique", "Les éolismes dans la langue de l'épopée grecque", and "La métathèse de quantité et les ionismes chez Homère". The work is rounded off by an introduction (with prominent methodological discussion) and a concluding chapter, and is provided with a bibliography of works cited and a helpful "Index verborum potiorum" (Greek words only).[1] Haug's goal is to reassess the contributions of each of these dialect areas to the prehistory of epic diction and its development into the mixed-dialect Kunstsprache of the Homeric poems. In each case, Haug comes to focus on what he considers the most salient feature: traces of syllabic *r* in Homer as an alleged Achaean element,[2] the thematic gen. sg. in -οιο as a possible Aeolism, and the nature and chronology of quantitative metathesis in Ionic. For this last, the argument depends in no small part on the analysis of nouns of the βασιλεύς type (111–117) and on the inflection of πόλις (117–121). Thus, apart from a brief discussion of the scansion of certain types of verbal stems with re-

[1] The relatively numerous typographical errors (just over two dozen, by my count) are merely annoyances, with one potentially confusing exception: on p. 97, read "ἔο … εἷο" for the nonsensical "ἔο … ἔο".

[2] A feature on which much continues to be written; post-Haug e.g. I. Hajnal, Troia aus sprachwissenschaftlicher Sicht: Die Struktur einer Argumentation (2003) 66 f., 77, 79.

gard to quantitative metathesis and synizesis (123–4), virtually all of Haug's data involve phonology or nominal morphology (and their interaction).

In a nutshell: Haug concludes that while there is no support for specifically Achaean elements in epic diction, the gen. sg. in -οιο is to be interpreted as an Aeolism. As for quantitative metathesis, Haug's arguments favor the view (so already Bechtel, Schwyzer, and more recently J. M. Dosuna, Emerita 61, 1993, 95 ff.) that the resyllabification of ηο as (monophthongized) εῳ (the majority scansion in Homer) did not pass through an intermediate disyllabic stage εω, suggesting a relatively late date for this specifically Ionic feature of epic language. All of this, in turn, tends to support the theory of an earlier Aeolic phase with subsequent "Ionicization", essentially along the lines sketched by P. Wathelet (Les traits éoliens dans la langue de l'épopée grecque [1970]) and espoused in one form or another by many other scholars.

One may readily assent to this more or less conservative conclusion, even if Haug's argumentation is not equally convincing on all points. Thus, among minor issues, little confidence can be placed in Haug's preferred interpretation /ohw-o-wents/ lit. 'eared' for Myc. *o-wo-we* (56, part of a subsidiary argument against syllabic *r* in Mycenaean), since the "voyelle thématique 'de liaison'" of the type seen in Hom. -ο-(ϝ)εντ- is likely to be a post-Mycenaean innovation, as far as *-u̯ent- adjectives are concerned (cf. Myc. *pe-de-we-sa*, *te-mi-dwe-ta* [vs. Hom. τερμιόεις], etc.). For material more central to Haug's major claims: serious questions can be raised about the Indo-European formations said to underlie the βασιλεύς type and the noun πόλις. In the former, Haug sees "le développement grec d'un paradigme hystérodynamque indo-européen" (112), i.e. nom. *-ēu̯(-s), acc. *-eu̯-m, gen. *-u̯-os, loc. *-ēu̯ (113), whence various phonological developments and analogical adjustments yielding the attested forms. But there is little reason to believe that hysterokinetic paradigms originally showed lengthened grade of the suffix in the endingless loc. sg.,[3] and there is consequently little likelihood that the Old Ionic dat. sg. in -ῃ could reflect, as Haug would have it (115), a trace of this archaic loc. sg. form. More generally, Haug's analysis of Gk. -ευς as a primary hysterokinetic formation lacks any basis in lexical (or comparative) data – in distinct contrast to the well-motivated morphological analysis of J. Schindler (FS Palmer [ed. A. M. Davies and W. Meid, 1976] 349 ff.), according to which the formation is at bottom a matter of secondary derivation based on thematic stems, as the Greek data themselves plainly suggest.[4] Still less attractive is Haug's suggestion that πόλις originates in a root noun inflected as nom. sg. *pól-

[3] The hysterokinetic loc. sg. is widely agreed to have shown full grade of the suffix (type Ved. *pitári* etc.), cf. E. Rieken, Untersuchungen zur nominalen Stammbildung des Hethitischen (1999) 265, 272 f.; S. Neri, I sostantivi in *-u* del gotico: Morfologia e preistoria (2003) 31 ff.; X. Tremblay in FS Rasmussen (ed. A. Hyllested et al., 2004) 588.

[4] Haug explicitly rejects Schindler's analysis (114n48), without mentioning this important point in its favor. There is no space here to discuss Haug's two counterarguments, neither of which is in my view decisive.

h_1-s, acc. **pól-h_1-m̥*, gen. **pl-éh$_1$-s*, loc. **pl-éh$_1$*, nom. pl. **pól-h_1-es*. The "French" segmentation **pól-h_1-* (state I) ~ **pl-éh$_1$(-)* (state II) is particularly unfortunate, and the analysis is weakened, if anything, by Haug's invocation (120n53) of F. O. Lindeman's specious arguments against acrostatic gen. sg. forms of the type **nék^{u}-t-s* 'night' (FS Risch [ed. A. Etter, 1986] 146 ff.). Further discussion of this problematic paradigm must be left aside here. But however one judges these and other analyses, one must be grateful for many incisive discussions and intriguing suggestions, e.g. on the phonological interpretation of Myc. *-o-jo* (82 ff.; Haug argues for /-ohi̯o/ or /-ōi̯o/, versus /-oi̯̯o/), on the absolute and relative chronologies of the first compensatory lengthening (91; between KN and PY) and the Ionic quantitative metathesis (136 ff.; after loss of digamma but before the Attic Rückverwandlung), and on the possible relationship between the regularization of the proto-hexameter, with its Aeolic metrical features (cf. N. Berg, MSS 37, 1978, 11 ff.) and the transition from the Aeolic to the Ionic phase of epic diction (162 f.).

The main thrust of Hackstein's work, in contrast, is synchronic, and his material primarily addresses problems of verbal morphology (though with interesting forays into historical phonology and nominal morphology). The work is divided into nine chapters. The first introduces the major topic of interest ("Präliminarien zu Archaismus und Innovation in der Dichtersprache", 1–34), but the first four (1–91) constitute a lengthy (perhaps too lengthy) theoretical and methodological preamble. There follow a series of data-oriented chapters analyzing "Struktureller Wandel und Anachronismen" in a series of verbal categories (as they appear in early epic): athematic presents (92–135) and aorists (136–147), the perfect (148–253) and pluperfect (254–277). A concluding chapter is followed by a bibliography and a generous set of indexes (rerum, verborum, locorum).

Hackstein explores the value of linguistic anachronisms, in an attempt to delineate some of the features of Ionic vernacular lurking in epic language – a project initiated long ago in the work of Witte, Parry, and others, but one that has thus far not met with notable success. As a tool in this effort, Hackstein proposes a distinction between "anticipatory" anachronisms (those that eventually surface in later forms of the language) and "isolative" (or "abortive") anachronisms (those that fail to take hold in the language, and which are therefore more or less restricted to Homer, even if they belong to the contemporary vernacular). It is evident that the task of disengaging the latter, in particular, from artificial constructs of the Kunstsprache will not be an easy task, and indeed Hackstein's conception has already led to an extended debate on this problem, as well as the related question concerning the alleged Ionic status (as opposed to the possible Aeolic provenance) of at least some such "isolative" phenomena: see Haug's review of Hackstein, in BMCR 2003.06.31, as well as Hackstein's detailed rejoinder (BMCR 2004.03.12) and Haug's reply to that (BMCR 2004.03.44). One must agree with

Haug, in any case, that "the recognition of secondary ablaut patterns is one of the book's great merits", and that Hackstein's demonstration of such morphological innovations in the perfect system is particularly convincing. Thus, as Hackstein shows (222 ff.), Hom. μέμηλε 'is a concern' (root **melh$_1$-*) does not, as is often claimed, result from a metathesized *με-μ(β)λη-ε, but reflects rather a secondary lengthened-grade **me-māl-* (cf. Pi. μεμᾱλότας) based on the prevocalic zero grade (**me-mal-V* < **me-m̥lh$_1$-V*).[5]

This overall result seems likely to stand, even if individual analyses fail to convince. For Hom. γέγωνε 'cries out' (187 ff.), Hackstein rightly rejects the traditional account that operates with a metathesized *γε-γνω-ε based on PIE **ĝneh$_3$-* 'know',[6] a construct that has no more justification than the similar one proposed for μέμηλε. His own etymological and morphological suggestion, however, is more clever than it is persuasive. He proposes a root **gh$_3$en-* or **ĝh$_3$en-* (the unusual shape of which elicits no comment), supported with recourse to Toch. A *ken-* 'call'; but the comparison is far from straightforward, as **g/ĝh$_3$en-* would yield a pre-E. Toch **kan-*, an "allomorph" of the **ka^{y}ñ-* (cf. 3 sg. imperf. *keñā*) which then in E. Toch. spreads its *e*-vocalism to the present. The *ō*-vocalism of γέγωνε is ascribed to a hypothesized desiderative present **g/ĝh$_3$en-[h$_1$]se/o-* (for wich there is no independent support); but despite the partial parallel of Hom. προβέβουλα, such a derivational path (desiderative present → stative "neo-perfect") remains to be established. Nor is *γωνε/ο- transparently the expected phonological result of Pr.-Gk. **gonse/o-* (see Hackstein's own discussion, 190 f.).[7] For Greek long-vowel perfects in -ω-, Hackstein cites (189) only cases in which the -ω- may or must result from phonological lengthening, as in ἄνωγε 'commands' (if this arises from contraction) or ἔρρωγε 'breaks' (with laryngeal-induced lengthening). But a case like (Att.) εἴωθε (Hom. ἔωθεν) 'is accustomed' < **se-su̯ōd^h-e* shows that forms of this sort may in principle reflect archaic "lengthened-grade perfects", however such Greek perfects are to be interpreted both historically, and in their relationship with lengthened-grade preterites outside Greek (see recently J. Jasanoff, Hittite and the Indo-European Verb [2003] 31). As I hope to show elsewhere, it is this type that may provide a simpler solution to γέγωνε (so also Tremblay, loc. cit. [n. 6 above], but with an unacceptable etymological source in PIE **ĝneh$_3$-*). The obvious moral of this exemplum: in a work so rich in closely-argued case studies, readers must exercise care in evaluating a great variety of proposals, some more attractive than others. And as with Haug, we are rewarded by a wealth of penetrating treatments. Among the most compelling is Hackstein's defense of the "renasalization" of nasalis sonans zero grades, a process that cuts across verbal and nominal morphology (like the secondary lengthened grades mentioned above): thus

---

[5] Nor are such patterns restricted to the verbal system: see e.g. 225 on βῆσσα.

[6] He does not address X. Tremblay's updated version via a form of the root with Schwebeablaut (EC 33, 1997, 116 f.), but this, too, is to be rejected.

[7] I leave aside further details concerning Hackstein's interesting (but in my opinion problematic) comparison of Gk. βοᾶν/γοᾶν 'shout' (sometimes collocated with γέγωνε) and Toch. A *kāk-* (suppletive to *ken-*).

Hom. δήνεα 'counsels' can be explained (185 ff.) by a renasalized zero grade /dans-/ (replacing regular **das-* < **dn̥s-*), cf. full grade **déns-os* in Ved. *dáṁsas-* 'wisdom, skill'. So also for δάμνημι (13, 179), χανδάνω (180 f.), μανθάνω (227 f.), and a number of other forms (186).

The stark differences between these two works on Homeric language should not obscure several significant convergences, above all their skeptical attitude toward Achaean elements (and especially syllabic *r*) in Homer (Hackstein 5 ff., 13 ff.) and their sympathy for the notion of a proto-hexameter along the lines of the theory proposed by Berg (Hackstein 9, cf. now Hajnal, op. cit. 73 ff.). We are fortunate in having the guidance of these two important works, as debate on these points and on many other matters of epic language continues.

Latin vulgaire – latin tardif VI. Actes du VI[e] colloque international sur le latin vulgaire et tardif. Helsinki, 29 août – 2 septembre 2000. Éds. par Heikki Solin, Martti Leiwo, Hilla Halla-aho. Hildesheim usw., Olms-Weidmann, 2003, gr.-8°, XVI, 594 S. Brosch. 88 €.

Wie schon aus dem Titel hervorgeht, handelt es sich bei dem zu rezensierenden Band um die Akten des 6. Colloquiums für Vulgär- und Spätlatein, das diesmal weitgehend im Zeichen des 1997 verstorbenen, wohl bekanntesten Vertreters der vulgärlateinischen Forschungen, Veikko Väänänen, stand, dem zu Ehren auch Helsinki als Tagungsort ausgewählt worden war.

Nach einem Vorwort der Herausgeber, einer auf Lateinisch gehaltenen Salutatio und zwei Inhaltsverzeichnissen (einem nach der Seitenzahl und einem alphabetisch nach Autorennamen geordneten) findet sich als Hauptteil des Buches eine Sammlung von 42 Artikeln; ein Adressenverzeichnis der verschiedenen Autoren schließt den Band ab. Die einzelnen Beiträge geben dem Vorwort (S. V) zufolge „un témoignage vivant de l'ampleur des questions concernant l'actuelle recherche sur la latinité vulgaire et tardive – tardive dans le sens étendu qui comprend aussi le Haut Moyen-Age". Das somit sehr breit gefächerte Feld ist in 5 Sektionen unterteilt: „Problèmes généraux et structuraux", „Textes et documents", „Variation linguistique", „Questions lexicales" und „Système grammaticale [sic]". Da sich die Zuordnungskriterien überschneiden, passen meh-
