Greek *-ίσκω* and Indo-European "**-iśke/o-*"

1. It continues to be assumed that Greek *-ίσκω* and a variety of verbal formations elsewhere are built with an Indo-European morpheme **-iśke/o-* (or, via a more complex analysis, **-ǐ-śke/o-*), a variant of the thematic suffix **-śke/o-*.[1]) But there is very little evidence that such a variant existed at the level of Indo-European. This seems to me to be the general purport of G. Klingenschmitt's analysis of most of the forms in question,[2]) the implications of which deserve to be made more explicit.

2. The sole word-equation adduced in support of an Indo-European **-iśke/o-*, namely Lat. *expergīscor* 'awaken (intrans.), be alert': Av. *fraγrisəmnō* 'awakening (intrans.)' (thus allegedly **(h₁)gr-iśke/o,* cf. the **h₁ger-* of Gk. *ἐγείρω* 'awaken (trans.)'), is fraught with indeterminacies, even granting the dissimilatory loss of the second *-r-* in the Latin form, and disregarding the weak attestation of the Avestan form.[3]) These forms have been treated *in extenso* not only by Klingenschmitt, but also by M. Keller (*op. cit.* 309 ff., cf. also *RPh* 59 [1985] 27 ff.); the thorough philological discussions of both scholars have underscored the problems that beset this "equation": note especially the corresponding Middle Iranian inchoative, with the entirely different stem-form **(u̯i-)grā-(sa-)* (cf. Parth. *wy-gr's-*, Sogd. *w-γr's-* etc.), already attested in Avestan *fraγrātō, fraγrāγrāiia-, fraγrāraiia-*,[4]) as well as the difficulty in determining (and reconciling) the quantity of the *-i-* preceding the **-śk-* (transmitted as short in

---

[1]) In the context of Armenian, e.g. R. Godel, *Introduction to the Study of Classical Armenian* (Wiesbaden 1975) 116 f. and *RÉArm.* n.s. 14 (1980) 11 ff. = *Linguistique arménienne: Études diachroniques* (Paris 1982) 81 ff. (cf. also 28 f.); K. H. Schmidt, *KZ* 98 (1985) 214 ff.; G. R. Solta, *Kratylos* 29 (1984 [1985]) 73, following C. Watkins, *Indogermanische Grammatik* III/1 (Heidelberg 1969) 55 ff.; more broadly (assuming **-ǐ-śke/o-*), M. Keller, *BSL* 75 (1980) 319.

[2]) *Das altarmenische Verbum* (Wiesbaden 1982) 41 ff.

[3]) As a hapax in the Haδoxt Nāsk (H. 13), the form is an insecure foundation for Indo-European reconstructions, as J. Kellens has observed (*Le verbe avestique* [Wiesbaden 1984] 156 f.).

[4]) Whence Kellens' suggestion that Av. *fraγrisəmnō* might even be an error for **fraγrāsəmnō* or **fraγ(ə)rəsəmnō*.

Avestan, but not unequivocally in such manuscripts; probably long in Lat. *-īscō* and *-īscor,* given inscriptional and manuscript spellings *-eisc-*). The most serious indeterminacy, however, is that whether we reconstruct a **h₁gr-ĭśḱe/o-* or a **h₁gr-īśḱe/o-,* the *-ĭ-* can in principle be explained secondarily: *-ĭ-* on the basis of an enlargement *-(e)i-*,[5]) and *-ī-* as a secondary stem **(h₁)grih$_x$-*, ultimately based on the laryngeal-enlarged stem **(h₁)gr-h$_x$-* of Iran. *-grā-* (*sa-*), according to patterns not uncommon in *TERH* roots: cf. **g$^{\mu}$r̥h$_2$-* (*βαρύς* etc.): **g$^{\mu}$rih$_2$-* (*βρῑθω, βριαρός*) and **g$^{\mu}$ruh$_2$-* (Lat. *brūtus,* Latv. *grūts*).[6])

3. Beyond this "equation", most categories said to show IE **-śḱe/o-* can be explained as einzelsprachliche innovations. Thus the Latin non-denominative verbs in *-īsco(r)* may be based on **-i̯e/o-* verbs: cf. *concupī-scō* 'long for' (to *cupiō*), *obdormī-scō* 'go to sleep' (to *dormiō*), etc.[7]) Here there is the difficulty of accounting for forms like *pacīscō* (Plt.) / *pacīscor* (ptcple. *pactus*) 'agree on, reach an agreement', which either have no parallel present attested, or which show traces of a different type of present formation (cf. plain thematic *pacunt* XII Tab.). But, as often with such small morphological subgroups in Latin, an analogical renewal can be associated with a semantic "common denominator" shown by a number of the forms: thus *concupīscō, apīscor* 'reach for, attain', *nancīscor* 'obtain', *proficīscor* 'set out' share a pseudo-desiderative force that may help account for new presents like *pacīscor;* then, once the pattern (*aptus/apīscī, pactus/pacīscī*) is established, new presents like *ul[c]tus/ulcīscī* 'avenge, obtain vengeance' can arise in their turn.

4. Despite the routine use of an IE **-iśḱe/o-* to explain various Armenian formations,[8]) the Armenian data can be explained in equally plausible ways without recourse to such an entity. For present formations: excluding, of course, verbs with a sequence **-iśḱ-* in which the *-i-* belongs to the root and the suffix is simply **-śḱe/o-*,[9])

---

[5]) See Klingenschmitt on Alb. *ngrē* 'raise' (perhaps **en-greu̯-e/o-* or **en-grou̯-eu̯e/o-*); similarly ("thème en **-i-* " for Av. *-γrisa-*) already A. Meillet, *Introduction à l'étude comparative des langues indo-européennes* (Paris 1937; repr. University, AL 1964) 221.

[6]) For this latter conception of Klingenschmitt, cf. already, *mutatis mutandis,* J. Schmidt's "long-diphthong" **grēi-* : **grī-,* in his fundamental study of Gk. *-ίσκω, KZ* 37 (1904) 26 ff.

[7]) M. Leumann, *Lateinische Laut- und Formenlehre* (Munich 1977) 536 ff., followed by Klingenschmitt.

[8]) See for example Godel and K. Schmidt, *locc. cit.* (n. 1 above).

[9]) Eg. *hangčʿim* (< **han-gičʰi-*) 'rest' (following Klingenschmitt, perhaps from **-k$^{\mu}$ih₁-śḱe/o-,* cf. Lat. *quiēscō* perhaps for **quīscō*), *erknčʿim* (< **erkinčʰi-*) 'be afraid' (**du̯i-n-śḱe/o-* to **du̯ei-*).

there are indeed other forms with an element **-ic^h-* (in Armenian terms) in which the *-i-* (in principle reflecting Proto-Armenian **-ǐ-* or **-ē-*) does not belong to the root, and for which actual Indo-European **-śke/o-* presents are not reconstructable. But in view of the generally stative and middle semantics of many of these forms, as well as their restricted semantic range (*t'ak'č'im* 'hide (oneself)', *xrtč'im* 'be frightened', *t'řč'im* 'fly', *p'axč'im* 'flee', etc.), Klingenschmitt may be correct in postulating a suffixal agglutination **-eh$_1$-śke/o-,* with the sequence "stative suffix + **-śke/o-*" (cf. Lat. *conticescō*).[10])

For the subjunctive (**-ic^{h}e/i-*) Klingenschmitt provides an intricate analogical account which will indeed produce such formations without recourse to an IE formant **-iśke/o-*. But if his scenario is judged to be excessively complex (as it seems to me), the traditional Meillet/Mariès analysis remains available, according to which the thematic optative stem (**-oi-* < **-o-ih$_1$-*) is characterized by a "**-śke-* preterite".[11]) There is, then, nothing in Armenian that requires an IE **-iśke/o-*.

5. Among Hittite verbal formations with a descriptive sequence *-iške-,* there are two classes which show consistent *-iške-* in Old Hittite, with alternations *-iške-/eške-* appearing in Middle Hittite and Neo-Hittite.[12] Recent work by C. Melchert on *e* and *i* in Hittite has clarified the nature of these formations, neither of which provides evidence for an Indo-European thematic suffix **-iśke/o-*. Thus in iteratives like OH/MH *šanḫiške-* 'search', MH *šarninkiške-* 'make restitution' (beside *šarninkeške-*), the *-i-* results from a regular anaptyxis after guttural and before the sequence *-s-* plus consonant, cf. preterites like 2/3 sg. *šakkiš* 'knew', *akkiš* 'died'.[13] Similarly, iteratives

[10]) Even if (as Klingenschmitt suggests) *t'ak'č'im* itself is cognate with Gk. *πτώσσω/πτήσσω* (aor. *πτηκ-* (*-ᾱ-*)*/πτακ-*) 'duck, crouch' and Lat. *tacēre* 'be silent', the resulting **(p)th$_2$k-eh$_1$-śke/o-,* together with several other forms of the type Gk. *ἀλδήσκω,* do not, in my view, justify Klingenschmitt's projection of **-eh$_1$-śke/o-* back to Indo-European; but this does not exclude the possibility of explaining *t'ak'č'im* et al. on the basis of an **-eh$_1$-śke/o-*.

[11]) Recently e.g. J. Jasanoff, *IF* 88 (1983) 81 n. 44.

[12]) On presumed Hittite-Armenian correspondences involving IE **-śk-* and **-iśk-,* see M. Morani, *Annual of Armenian Linguistics* 2 (1981) 54 f.

[13]) In view of this process, G. Rikov's analysis of Hitt. *paške-* 'set upright' in terms of a **pak-ške-,* with dissimilatory loss of the first velar (*Linguistique balkanique* 25.2 [1982] 24), would be phonologically aberrant; therefore Rikov's comparison of Hitt. *paške-* with Lat. *pacīscor* may be entirely specious.

All use subject to JSTOR Terms and Conditions

like *anniške-* 'perform' or *zaḫḫiške-* 'fight' arise from a syncope of original **anniyaške-* (cf. *anniya-*), **zaḫḫiyaške-* (cf. *zaḫḫiya-*), etc.[14]) Individual iteratives like *išḫiške-* (to *išḫai-* 'bind') simply reflect "long-diphthong" stems: thus here **seh₂i-*, via an unmetathesized or restored **h₂i-sh₂i-ske/o-* (or perhaps simply Anatol. *išḫi-* + *-ške-*, cf. CLuv. *ḫišḫiya-*); such forms, then, likewise fail to support an IE **-iske/o-*.[15])

6. It is far from self-evident, then, that Gk. *-ίσκω*[16] derives from an Indo-European suffix **-iske/o-*. On the other hand, a satisfactory account of *-ίσκω* is thus far lacking. In this sense, then, the status of an IE **-iske/o-* (or **-ške/o-*, à la Keller) depends on the need to posit such a formant for Gk. *-ίσκω*.

The similarity between Gk. *-ίσκω* and the Gk. nominal suffix *-ίσκος* has led to the suggestion that the two are genetically related.[17]) Since nominal *-ίσκος* has some claim to an Indo-European pedigree (cf. Go. *-isks*, OCS *-ъskъ*, Lat. *-iscus* etc.), this would seem to provide an argument for the Indo-European status of *-ίσκω*, and hence the idea that *-ίσκω* is to be compared directly with Lat. *-īscor*, Arm. *-icʿ-* etc. reflecting an Indo-European suffix **-iske/o-*. But the comparison of *-ίσκος* and *-ίσκω* has little to recommend it. To be sure, nominal formations in **-isko-* are prominently attested in Greek, Latin, Germanic and Balto-Slavic (with perhaps some traces elsewhere). But the relationships among these forms are not entirely clear, and even the reconstruction of an Indo-European (or perhaps "Western Indo-European") **-isko-* for Gk. *-ίσκος*, Lat. *-iscus* etc. is not a foregone conclusion.[18]) Even if one grants the existence of an IE **-isko-*, no

---

[14]) C. Melchert, *Studies in Hittite Historical Phonology* (Göttingen 1984) 102, 108, 134, 148.

[15]) In theory, the *-i-* of *išḫiške-* could also result from anaptyxis, based on an unenlarged **h₂i-sh₂-ske/o-*.

[16]) In addition to J. Schmidt (*op. cit.*): E. Risch, *Wortbildung der homerischen Sprache*[2] (Berlin 1974) 272 ff.; E. Schwyzer, *Griechische Grammatik* (Munich 1939) 709 f.; P. Chantraine, *Grammaire homérique* I (Paris 1958) 317; *Morphologie historique du grec*[2] (Paris 1961) 225, 320; H. Rix, *Historische Grammatik des Griechischen* (Darmstadt 1976) 213.

[17]) E.g. P. Wathelet, *L'Antiquité classique* 42 (1973) 379 ff.; for *-ίσκω/-ίσκος*, esp. 384 f., with n. 37.

[18]) Among various problems, note the lack of clear word-equations, together with the fact that some **-isko-* forms (cf. especially Greek and Germanic) show a marked tendency toward productivity; the numerous Greek and Latin forms suspected of "Mediterranean" provenience or influence (e.g. botanical terms: *hibiscum, tamariscus* etc.); and the problematic status of the Balto-Slavic velars (IE **-isko-* or IE **-iske-*?), which is in turn complicated by uncertainties about the

All use subject to JSTOR Terms and Conditions

doubt originally a morphologically complex sequence,[19]) the fact remains that for the Greek material itself, there is not the slightest congruence between *-ίσκος* forms and *-ίσκω* verbs, beyond their superficial resemblance. Thus an IE adjectival **-is(-)ko-* (or **-is(-)ḱo-*) cannot directly support an IE verbal **-iśke/o-* – or even the antiquity of Greek *-ίσκω* – without recourse to the most improbable (and in any event untestable) hypotheses, such as that nominal **-isko-* forms somehow led to denominative verbs in **-iśke/o-*.

7. The quantity of the *-ι-* of *-ίσκω* being impossible to determine, the traditional strategy, since J. Schmidt's pioneering study, has been to assume a long *-ī-*, and then to argue for a "long-diphthong" source; but such sources have proved difficult to support, either on the basis of systemic parallels within Greek,[20]) or external comparanda with the various *-ίσκω* verbs.[21])

Less attention has been paid to ways of explaining the formation as a Greek innovation. According to such an approach, primary importance should be attached to accounting for the salient features of this class as they appear in Greek, among which a special importance attaches to the pivotal status of the thematic aorist, both chronologically and derivationally, as is evident from the Homeric data alone.[22])

---

possible Germanic origin of some of the BSl. forms. Against relationship between Lat. *-iscus* and Gk. *-ίσκος:* Leumann, *op. cit.* (n. 7 above) 340.

[19]) Perhaps (with K. Brugmann, *Grundriß der vergleichenden Grammatik der indogermanischen Sprachen*[2], I. 1 [Straßburg 1906] 501 ff.) an adjectival agglutination of comparative **-is-* followed by **-ko-*, cf. superlative **-is-to-* and "**-is-mo-*" (**-is-m̥mo-*), whence an abstracted **-isko-* extended to nominal bases (OHG *mannisc* 'menschlich' < *man* 'Mann'), later subject to substantivization (*mennisco/mannisco* 'Mensch').

[20]) Thus *-ι-/-η-* of the type *εὑρίσκω/εὑρήσω (NB: εὑρήσω* only H. Merc. 302+, cf. n. 22 below), which, despite Chantraine (*Morph. hist.* 320), need not be an archaism comparable to *μαίνομαι/ἐμάνην.*

[21]) Thus *πιπίσκω* 'give to drink' has no bearing on the source of *-ίσκω,* despite its "long-diphthong" root **peh₃-i-* (zero-grade **pih₃-*), since the form has been built to the factitive sigmatic aorist *ἔπῖσα* (Chantraine, *Morph. hist.* 181, 224 f.); Schmitt-Brandt's assertion of an "*i*-Erweiterung" for *ἁλίσκομαι* vis-à-vis Hitt. *ḫullāi, ḫulliya-* 'fight' (*Die Entwicklung des indogermanischen Vokalsystems* [Heidelberg 1967] 91, 119) rests on an unlikely etymology, which in turn depends on his unorthodox assumptions about the development of **Hu̯-* in Greek.

[22]) *ἀπαφε/o-* (7×) : *ἀπαφίσκω* (1× *Od.*) 'deceive', *ἀραρε/o-* (10×) : *ἀραρίσκω* (1× *Od.*) 'join, fit', *ἐπαυρε/o-* (10×) : *ἐπαυρίσκομαι* (1× *Il.*) 'reach', *εὑρε/o-* (90×) : *εὑρίσκω* (1× *Od.*) 'find'; for *ἀπαφε/o-* : *ἀπαφίσκω* and *εὑρε/o-* : *εὑρίσκω,* these are the only two formations attested in Homer (cf. Risch, *Wortbildung* 276). The single alleged Mycenaean instance of an *-ίσκω* verb is uncertain (see *Appendix 1* on Myc. *te-ra-pi-ke*), and *ἀπαφίσκω* is discussed further in *Appendix 2.*

This content downloaded from 194.29.185.230 on Wed, 18 Jun 2014 12:23:55 PM
All use subject to JSTOR Terms and Conditions

It is also striking that three of the four verbs attested in Homer have stems ending in *-ϱ-* (i.e., all except *ἀπαφίσκω*, cf. *Appendix 2*), and a similar predilection for liquids is evident in the post-Homeric material as well (cf. *ἁλίσκομαι* 'be taken' [Herod. +], *ὀφλισκάνω* 'owe' [Soph. +], *στερίσκω* 'rob' [Herod. +]). Although the limited number of forms renders evaluation difficult, this restricted phonetic inventory may be significant.

8. For an inner-Greek explanation, one could hypothesize, for example, that verbs like Hom. *εἴσκω* (**ϝε-ϝικ-σκ-*) 'liken' or *δειδίσκομαι* (**-δικ-σκ-*) 'greet', in which a sequence *-ίσκω* results from a cluster reduction, could have led to a resegmented pseudo-suffix *-ίσκω*. Unfortunately, this would account neither for the morphological patterning of the *-ίσκω* verbs, nor for their predilection for stems ending in *-ϱ-* (or liquids more generally). Only Klingenschmitt, to my knowledge, has attempted to explain this latter feature: he suggests that in view of the possible equation Lat. *expergīscor.* Av. *fraγrisəmnō* (cf. §2 above), there may have existed a Greek counterpart **ἐγρίσκω* (or **ἐγρίσκομαι*), which might somehow help account for the tendency to develop presents in *-ρίσκω/-ρίσκομαι*, if this is not due to chance. But this is not an attractive explanation. Even if one assumes that an **ἐγρίσκω* (or **ἐγρίσκομαι*) ever existed (for which there is no actual evidence), it is unclear how a single such form – even an inherited one – could have institutionalized, so to speak, such a phonetic restriction.[23]) An acceptable explanation, in contrast, should associate stem-final *-ϱ-* (or liquids) and the following *-ι-* in some phonologically natural way, which is at the same time consistent with the morphological profile of both Indo-European **-ske̯/o-* and the Gk. *-ίσκω* verbs.

9. There is, I suggest, a method of doing just this, which nevertheless raises many problems of its own; by way of conclusion, then, it seems appropriate merely to sketch the form such an explanation might take.[24])

In its barest structural terms, the problem can be restated as fol-

---

[23]) An instructive parallel involving *-ίσκω* itself appears in the (late medieval) Cypriot Greek productive suffix *-(i)nisko,* which arose via resegmentation of (a critical mass of) roots with final *-(i)n-,* thus *min-isko* 'remain', *pomin-isko* 'be patient' (cf. Class. Gk. *μένω*), *fanisko* 'weave' (cf. Class. Gk. *ὑφαίνω*) etc., whence *varinisko* 'become heavy', *pollinisko* 'increase' etc. (M. Tsiapera, "The Lexicon in the Makhairas Chronicle", paper presented at the Ninth International Congress of Historical Linguistics, August 1989).

[24]) Cf. Chantraine, *Morph. hist.* 225: "sur l'origine de cette forme [*-ίσκω*] on ne peut faire que des hypothèses".

All use subject to JSTOR Terms and Conditions

lows: stem-final liquids, in a verbal category for which zero-grade is appropriate (**-ske/o-* present-formations), are followed by an unexpected vowel, before a consonant-initial suffix, i.e. (schematically) *-RV-ske/o-*. In principle, such a profile suggests laryngeal vocalization as a possible source for the unexpected vowel. In fact, K. Strunk has claimed that Greek pre-consonantal zero-grade sequences of the type *TRh₁-* develop as *Τολι-/(Τορι-)*, as in *δολιχός, πόλις, ἀμβολιεργός.*[25]) M. Peters[26]) has strongly argued against a disyllabic outcome as the regular development for such sequences, as opposed to the long-vowel *TRē-* outcome. He himself, however, opts for disyllabic outcomes under certain circumstances involving secondarily-stressed forms, with developments *TRH₁,₂,₃-* > *TaRe-/TaRa-/TaRo-*, and other scholars admit similar sequences (e.g. Rix[27]), representing another widespread view: *TRH₁,₂,₃-* > *TeRe-/TaRa-/ToRo-*). Of itself, it would not be particularly surprising if a first laryngeal (under some circumstances) vocalized sometimes as *-e-* and sometimes as the higher front vowel *-i-*. Thus forms like *κι-κλή-σκω* 'call' (< **-klh₁-ské/ó-*), with the long-vowel outcome, would show the expected *unstressed* treatment of an original *TRh₁s-ké/ó-* (cf. *θνήσκω, γιγνώσκω,* etc.); at the same time, however, competing secondarily-stressed forms *TRh₁-ske/o-* (cf. Skt. *gácchati*)[28]) would have developed as *"ToRiske/o-"* (assuming a Strunk-style treatment), which might be expected to be remodeled as *"Tariske/o-"*, after corresponding thematic aorists *TaRe/o-* (< *TRh₁-é/ó-*).[29]) Even though such a *"TaRiske/o-"* would historically represent *"TaRi-ske/o-"* present/aorist pairs like *"TaRiske/o-"*: *"TaRe/o-"* could easily have been reanalyzed as *"TaR-iske/o-"*: *"TaR-e/o-"*, as if with a present suffix *"-iske/o-"* added to the aorist stem; forms of this type would then establish the

---

All use subject to JSTOR Terms and Conditions

derivational pattern "thematic aorist stem in final *-R* + *-iske/o-* (*-ίσκε/o-*) = new present stem", as the attested Greek data appear to show.

There is no direct evidence for these developments among the *-ίσκω* verbs themselves, although there are some suggestive possibilities.[30]) Nevertheless, an inner-Greek solution of this sort has the capacity to explain, in a relatively natural way, certain key features of the *-ίσκω* verbs, including the restriction to *-ρίσκω* (if this is real). We may wish, then, to abandon the unclear and possibly otiose concept of an Indo-European **-iske/o-* or **-ĭ-ske/o-* beside plain **-ske/o-*, and to seize the unusual opportunity of actually simplifying the nature of the Indo-European verb. But the cost may be prohibitive, since it may depend on accepting a still-controversial form of laryngeal vocalization in Greek – unless a better source for *-ίσκω* can be found.

Appendix 1: Mycenaean te-ra-pi-ke

Myc. *te-ra-pi-ke* (PY Eb 842, Ep 613.8) is generally interpreted as *t^{h}erapiskei* (**θεραπίσκει*) 'θεραπεύει', producing the sole Mycenaean *-ίσκω* verb thus far detected. This interpretation is widely accepted: in addition to Ventris-Chadwick, it is invoked, with varying degrees of confidence, by Ruijgh, Doria, Wathelet, Adrados, Tovar, Deroy-Gérard, and more recently Duhoux, who discusses the term in some detail.[31]) But there are serious indeterminacies that render this analysis far from certain.

As noted by Lejeune,[32]) such a denominative use of *-ίσκω* (otherwise attested only very late and sporadically) is alien to the general profile of most other *-ίσκω* verbs (cf. §7 above), and is therefore

---

[30]) A *TERh$_1$* root is a strong possibility for *εὑρίσκω* (cf. *εὕρηκα*, OIr. *-fríth*), although the precise analysis of the (obviously basic, and abundantly-attested) aorist stem is unclear (cf. Chantraine *DELG* s. v.). Note also the possible existence of a **h$_2$erh$_1$-* (aor. *ἀρέσαι* to *ἀρέσκω* 'satisfy', cf. also *ἀρέτη*), perhaps related to the anit **h$_2$er-* of *ἀραρίσκω* (cf. perf. *ἄρμενος*).

morphologically aberrant vis-à-vis *ἀραρίσκω, εὑρίσκω, ἁλίσκομαι,* etc. The form *terapike,* moreover, is attested in two parallel passages that pose extreme interpretive difficulties, partly for other reasons: PY Eb 842 *sasawo ekeqe onato kamaeu / epiqe toe terapike tosode pemo* WHEAT 1 T[5] ~ PY Ep 613.8 [*sasawo*] *onato eke kamaeu epiqe tome terapi*[*ke*] *toso pemo* WHEAT 1 T 5. Without belaboring the complex problems surrounding certain key terms in the land-holding tablets, one can say that the crux of the matter is the puzzling *toe / tome:* despite numerous attempts, no convincing explanation for this alternation has been found, and there is thus no certainty as to how the form (or forms) should be interpreted.[33]) Under the circumstances, *toe / tome* could as easily be taken to be a verb,[34]) in which case *terapike* as a 3 sg. **θεραπίσκει* becomes virtually impossible.

Lejeune (*op. cit.*), anticipated tentatively by Chantraine,[35]) has plausibly suggested that *terapike* is rather a noun in *-ίσκος,* referring to some minor functionary designated as a **θεραπίσκος;* the form would then be a locative sg. *t*^{h}*erapiskei* 'chez le *θεραπίσκος*', parallel to the *o*-stem locative *didakare* (KN Ak 781.3 etc.) 'chez le *διδάσκαλος*' (if this interpretation of *didakare* is correct).[36]) Indeed, there are still other possibilities for *terapike* (as for *toe / tome*). For *terapike:* under a locative interpretation (if one goes so far as to grant a Myc. *o*-stem locative in **-ei*), a place-designation should be highly favored, *ceteris paribus.*[37]) One could consider, for example, a loc. sg. *terabiskei* 'in a shed/hut/?granary (**τεραβίσκος*)', cf. *τέραμνα* 'dwelling', if this reflects a stem **τεραβ-* ultimately comparable to forms like Lat. *trabs* 'beam', U. *tremnu* 'tent'. Myc. *terapike,* in any case, can bear very little weight as an instance of Myc. *-ίσκω.*[38])

Appendix 2: Hom. ἀπαφίσκω

G. Dunkel[39]) has proposed that *ἀπαφίσκω* 'deceive' (which otherwise has no good etymology) reflects an original **ἀπ-απ-ίσχω* 'keep off (repeatedly)', i.e., *ἴσχω* modified by a "preverbal amreḍita", to which a metathesis of aspiration (of the type *ἐνταῦθα* < *ἐνθαῦτα,* Ion. *βάθρακος* < *βάτραχος,* etc.) has subsequently applied. "Preverbal amreḍita" is no doubt a valid construct,[40]) and a prefixed *ἀπο-* may well be involved; but this particular analysis of *ἀπαφίσκω* cannot be correct.

With regard to the central fact about the *-ίσκω* verbs – namely the chronological and derivational priority of the thematic aorist – the aorist *ἀπαφε/ο-* (7× Hom.) beside the present *ἀπαφίσκω* (1× *Od.,* 1× Hes.) deviate not at all from similar patterns attested for the other *-ίσκω* verbs in early Greek epic, where this relationship is particularly clear (cf. §7 above). For Dunkel, however, *ἀπαφίσκω* continues the archaic formation, while the thematic aorist *ἀπαφε/ο-* is "innovatory", reflecting a "false generalisation, due to merger with optional *-(i)sḱ-*". But this "innovation" is not trivial. According to his scenario, the history of *ἀπαφε/ο-: ἀπαφίσκω* is exactly the reverse of that of *ἀραρε/ο-: ἀραρίσκω, εὑρε/ο-: εὑρίσκω* etc., in that *ἀπαφεῖν* has been back-formed from *ἀπαφίσκω,* after the pattern *ἀραρεῖν: ἀραρίσκω* etc. This in itself might be defensible in the abstract; but if *ἀπαφεῖν* has such a late and secondary status vis-à-vis *ἀπαφίσκω,* this should be evident from the textual attestations. Yet the texts, as we have seen (cf. n. 22), show precisely the reverse: *ἀπαφεῖν* – the alleged innovation – is well-established in Homer (including 3× in the *Iliad*), while *ἀπαφίσκω* – the alleged relic-form – occurs once in the *Odyssey* (and once in Hesiod). Although the numbers are not large, the complete structural parallelism with *ἀραρεῖν: ἀραρίσκω, εὑρεῖν: εὑρίσκω* etc. renders them decisive. We must conclude that the derivational basis of *ἀπαφίσκω* is the reduplicated aorist *ἀπαφεῖν* (as is generally assumed), which therefore invalidates Dunkel's hypothesis.

It may be noted in passing that the uncertainties surrounding Dunkel's **ἀπ-απ-ίσχω* prevent *ἀπαφίσκω* from serving as a *tertium comparationis* for his proposed iterated preverb equation Ved. *ápāpa* (RV 5.34.3 only): Hitt. EGIR-*pa* EGIR-*pa.* Indeed, neither of the

two instances he cites of iterated Hitt. EGIR-*pa* (i.e. *appa*) strikes me as convincing. In the passage from the Annals of Muršiliš (KBo III 4 II 11–12: *nu=war=aš=mu* EGIR-*pa* / EGIR-*pa ÚL paišta*), Goetze[41]) interpreted the double EGIR-*pa* to result from dittography, and so excised the first one from his text, as Dunkel himself notes. Indeed, the *position* of the two forms (end of line 11, beginning of line 12) renders dittography a paleographically attractive solution that is difficult to exclude, no matter how plausible one finds Dunkel's semantic interpretations of the force of the iteration.[42]) Similarly, in the example from the Alakšanduš treaty (KUB XXI 1 II 52), the first EGIR in the sequence EGIR EGIR-*an* is damaged, and was thus perhaps rightly bracketed by Friedrich.[43])

There is a further point that has never, to my knowledge, been adequately considered, but which may be significant, since it represents a feature that distinguishes *ἀπαφίσκω* from the other early *-ίσκω* verbs. I refer to the aorist *ἐξαπάφησα,* already attested at H. Apoll. 376 (and revived in later poetry; cf. also *ἐξαπαφοῦσα* H. Apoll. 379, H. Ven. 38). By and large, reduplicated aorists in Homer – not to mention verbs in *-ίσκω* – do not make new aorists of this kind. Such a form, then, may have a chance of reflecting something old. It may suggest, in fact, that *ἀπαφεῖν* was in origin not actually a reduplicated aorist, but rather a present **ἀπ-αφέω,* with aor. *ἀπ-αφῆσαι.* Then, at a relatively early stage, the sequence *ἀπ-αφ-* was reinterpreted as a reduplicated formation; whether or not *ἀπαφεῖν* was directly reanalyzed as a reduplicated aorist, the eventual result was a new reduplicated aorist *ἀπαφεῖν,* which all but ousted the older *ἀπαφῆσαι,* and which led to a new present *ἀπαφίσκω* after the pattern of *ἀραρεῖν: ἀραρίσκω.* The gloss *ἀποφεῖν· ἀπατῆσαι* Hsch. (if it is not simply an error) may provide a sort of missing link in this chain of events: if the original basis was **ἀποφέω* (whether **ἀπ-οφέω,* **ἀπο-φέω,* or **ἀ-ποφέω* cannot be determined), then a vowel-assimilation to *ἀπαφέω* (cf. *ὀβελός/ὀβολός, μέγαθος/μέγεθος* etc.) would provide a context for a reinterpretation as a reduplicated aorist. In any case, however (*ἐξ-*)*ἀπαφῆσαι* and *ἀποφεῖν* are to be interpreted,

these forms (neither of which Dunkel mentions) provide further evidence that the present *ἀπαφίσκω* has a (possibly complex) aoristic source, and not, so to speak, vice versa, as per Dunkel's analysis.[44])
