Anmerkungen

1 *Bucar* findet sich auch in der Wortliste der Arbeit von G. Breyer „Etruskisches Sprachgut im Lateinischen" (Wien 1984, S. 769).

2 Siehe E. Strnad: Nochmals zum Methodenproblem, in: WZs. d. HU (83/3). — Übrigens ist *urna* ‚Krug' auch nichts anderes als das arabische *burma* ‚irdener Topf' ohne anlautendes *b* (wie bei *aedis* < ar. *bait* ‚Haus').

Vedic *kūḷáyati* and "Spontaneous Cerebralization" in Sanskrit

Brent Vine

Sudbury

1. The literature on Vedic *kūḷáyati* 'scorches, singes' reveals two serious competitors for its etymology, each problematic in its own way. There is also a third etymology — neglected in the handbooks — which is at the same time equally plausible, but problematic in still a third way. An examination of these etymologies (and particularly of the third one) leads to some theoretical observations on the problem of so-called "spontaneous cerebralization" in Sanskrit.

1.1 RV *kūḷáyati* 'scorches, singes' (3 du. subj. *kūḷayātas*, 8.26.10) is generally said to belong with a number of words meaning 'coal, hearth, hot' and the like, e.g. Go. *hauri* 'coal', Olc. *hyrr* 'fire', OE *here* 'small oven' beside OE *heorþ* etc. 'hearth'; OCS *kuriti sę* 'smoke'; Li. *kárštas* 'hot, glowing', *kãrštis* 'heat' etc. (see IEW 571-2). Although the Gmc. forms are ambiguous with regard to the presence or absence of a laryngeal, Li. *kárštas* points to a set *$korh_x$-(s-)*, assuming that *kárštas* 'hot' reflects the original intonation, with *kãrštis* 'heat' the result of "métatonie douce"; cf. the parallel formations listed by Būga, KZ 51, 135 (= Raštai 2.423) and Stang, Opuscula 218, e.g. *ìlgas* 'long': *ilgis* 'length' (to * *(d)lh_1gho-)*. Thus Ved. *kūḷ-* appears to derive from *$kr̥h_x$-d-* (see also Wackernagel, Ai. Gr. 1.169). But this interpretation is phonologically difficult. The only other relatively old form which may show a similar treatment is *kūṭa-* (n.) 'hammer, mallet' (RV, AV), assuming an original *$kḷh_2$-to-* (:Li. *kálti* 'strike' etc.), an analysis which is far from certain (see Mayrhofer s.v., and further below.) This traditional view of the etymology of *kūḷáyati* then, hangs on a serious phonological indeterminacy.

1.2 An entirely different approach — less well-known than the first — arises from Kuiper's analysis of Skt. *krūḍayati* (Kāth., KapKS). Since Böhtlingk-Roth (2.507), *krūḍayaty* has been taken to mean 'thickens', leading to comparison with Av. *xrūždra-* (compar. *xraoždiiah-*, superl. *xraoždišta-*) 'hard'. But Kuiper (Turner vol. 1.349-50) has shown that *krūḍayati* means rather 'burns' or 'scorches', and is therefore a variant of Ved. *kūḷayati* 'id'. While this much appears certain, it is less clear how to account for the variant *krūḍ-* beside *kūḍ-*. Kuiper appeals to a process whereby an 'intrusive *r*' is inserted after an initial stop, in borrowed words whose second or third syllable began with a retroflex; thus e.g. Skt. *kūra-* 'boiled rice', but also (lex. only) *krūra-* (cf. Telugu *kūḍu*, Tamil *kūḻ*). Kuiper therefore views Ved. "*k(r)ūḍayati*" as a loan word, whose source is nevertheless unknown.

But there are several objections to this analysis. First, while the "intrusive *r*" phenomenon is fairly well documented in (esp. late) Class. Skt., Kuiper's attempt to demonstrate its existence in Vedic Skt. is not entirely successful. Apart from rare variant

readings of the type *hū́ḍu-*, *hrū́ḍu-*, *hrū́dru-*, *rū́ḍu-* (epithet of unknown meaning, AV 1.25.2,3), Kuiper adduces only Ved. *kroḍá-* 'breast' (AV, VS). For *kroḍá-*, he proposes a Munda etymology, comparing e.g. Santali *koṛam* 'chest, breast, bosom', Mundari *kuṛam* '(human) chest, breast (of birds)'. But by Kuiper's own admission (op. cit. 354), Munda words in *-am* are mostly early borrowings from Skt. and Prakrit.[1]

It is disquieting, moreover, that the two other relatively early forms which Kuiper sees as parallel to *k(r)ūḍayati* are not precisely parallel. For *vrīḍate* 'is ashamed' (Epic+, see further § 3.2.1 below), Kuiper accepts Burrow's etymology from Dravid. **viḍ-* (Tamil *viḷi-* 'to be overcome with shame' etc.), but is unable to support a Skt. **vīḍ-*. (The short vowel of Dravid. **viḍ-* renders comparison with a Skt. **vīḍ-* problematic in any case; cf. the discussion of *kū́ṭa-* 'hammer', § 2 below.) Similarly, for RV *krīḷati* (traditionally glossed 'plays, jokes', but probably rather 'dances, moves in a lively way' vel sim., see Kuiper, op. cit. 357ff.), the only evidence for a **kīḍ-* is provided by Kuiper's interpretation of the difficult RV hapax *kīríṇo* (5.52.12), which can be analyzed in a variety of ways. By contrast, Ved. *kūḷ-*, the *r*-less alternant of Kuiper's *k(r)ūḍ-*, is old and attested with certainty; in addition to RV 8.26.10, note also *akūḷayat* (v.l. *akūlayat*) AB 4.9.1, and *kūlayati*, *ava-kūlayati*, also *kūlita-* 'scorched, burnt', passim in Suśruta. Kuiper himself argues for the antiquity of *kūḷ-*, in citing the intervocalic spelling *kūlayen* with *l* in ĀpŚS 6.6.1, versus preconsonantal *ḍ* in *nikūḍya* (ĀpŚS 7.19.8), in accordance with RV conventions (op. cit. 350). Thus, even if *krūḍayati* is somehow a variant of *kūḷayati*, *kūḷayati* itself may well be better explained as an inherited form.

1.3 Among other IE etymologies proposed for *kud-*, apart from that sketched in 1.1 above (see Kuiper, FS Kirfel 171 for a brief listing), the old connection with Gk. *kaiō* 'kindle, set on fire' deserves consideration, despite its absence from IEW (see, however, W-P 1.376). Gk. *kaiō* points to a "long-diphthong" stem **keh₂-u-*, whose metathesized zero-grade **kuh₂-* is attested in Ba. forms pointing to a **kuh₂-ló-* (Li. *kūlěti* 'become mildewed', *kū́lés* 'smut-fungus; smut, dust (of grain), Latv. *kũla* 'last year's (dried) grass', see Fraenkel s.v. *kū́lés*). Although **kuh₂-* will directly account for the root vocalism of Ved. *kūḷ* (as the etymology in 1.1 will not), it will not explain the retroflex, since there is no evidence for a form **kuh₂s-*, or for any other *s*-forms to **keh₂-u-*. The etymology is attractive, then, only to the extent that the retroflex can be explained secondarily, the general problem to which I now turn.

2. Burrow has discussed in some detail a number of Skt. forms whose retroflex seems to have arisen secondarily from a form with dental, through a process of so-called "spontaneous cerebralization" (BSOAS 34, 538ff.). According to Burrow (building largely on work by Bailey; see Burrow, op. cit. 540 n. 4, for references), this phenomenon, which is relatively extensive, is independent of (and predates) Prakritic developments which are often invoked in order to explain the forms in question. Such forms result, then, from what can be described as a relatively early split of dentals into dentals on the one hand, and retroflexes on the other.[2] But no explanation is given for this "fissioning" (Bailey's term), and such retroflexes therefore remain fundamentally unexplained, whether or not one accepts the existence of such a process as that hypothesized by Bailey. One may also, of course, quibble with a number of etymologies; several, nevertheless, seem convincing. Thus, to return to *kū́ṭa* 'hammer': Burrow (op. cit. 550) rejects the Dravid. etymology recorded by Mayrhofer, which was phonologically problematic in any case (Dravid. **kuṭṭ* ≠ Skt. *kūṭ-*, whereas the Dravid. form is retained in Skt. *kuṭṭayati* 'crushes, bruises'). If the retroflex

arose "spontaneously" (and again, this is merely a descriptive term for the split apparently shown by a number of forms), then *kūṭa-* represents simply **kūta-*; this can then be taken as based on the zero-grade **kuh$_2$-* to **kuh$_2$-u-* (or **kauh$_2$-*) 'hew, strike' (OE *hēawan* 'hew', Li. *káuju* 'strike', OCS *kovǫ* 'forge' etc., IEW 535; for the long-diphthong reconstruction, see Jasanoff, MSS 37, 79ff.).

Burrow does not treat *kūḷayati* at all; but according to his theory, the stem *kūḷ-* could in principle represent simply **kūd-*. In this case, there is no obstacle to the etymology based on **keh$_2$-u-* 'burn' (§ 1.3 above), since all need for an allomorph with **-s-* is eliminated: **kūḍ-* simply continues **kuh$_2$-d-* directly, with a later development into *kūḷ-*.[3] This account of *kūḷayati*, then, is entirely equivalent to that of *kūṭa-*, and would presumably have been adduced by Burrow in the same context had he noticed the form.

Let us assume, for the moment, that these two analyses are correct, and moreover, that one could furnish enough parallel cases to justify the Bailey-Burrow hypothesis of some process of "spontaneous cerebralization". But what precisely is explained by such a hypothesis? Or, to put it another way, can one truthfully conceived of such a process as having been literally "spontaneous" in origin? As I have already suggested, the term is merely a descriptive label applied to a number of forms with unexplained — and apparently unexplainable — retroflex. As such, there is a real danger of promoting such a label to the status of an explanation, leading, in the worst case, to unconstrained etymologizing. If, as I believe, the concept of a truly "spontaneous" process of retroflexion is linguistically untenable, one should consider the forms an acceptable explanation of the data would take. In short, one would like to find either a sociolinguistic, phonological, and/or morphological basis for the conversion of an original dental into a retroflex, perhaps in a sufficient number of cases to have led to a generalized process; until such a basis is demonstrated, there can be no "explanation" for an unetymological retroflex via recourse to a hypothesis of "spontaneous cerebralization".

Despite the absence of *kūḷayati* from Burrow's extensive corpus, this form may well represent the only "explainable" case of unetymological retroflex adduced so far for the Vedic period, apart from forms which may anticipate Prakritic developments (see n. 2). In order to discover the bases for such an explanatiom, it will be necessary to survey the remaining relatively early Skt. verbal material with *-ḍ-*.

3. Consider first a core of forms with stem-final **s-d-* and relatively certain IE etymologies (3.1); these are followed by more ambiguous (and more controversial) data (3.2).[4]

3.1.1 RV *ī́ṭṭe* (3 pl. *ī́ḷate*) 'venerates, praises', to the **h$_2$eis-* of OHG *ēra* 'Ehre' etc.; cf. also GAv. *išasa-* 'beg for' (< **h$_2$is-d-sḱé/ó-*), Gk. *aidomai* 'be ashamed, respect', Go. *aistan* 'honor, revere'.

3.1.2 RV *áheḷat-*, *áheḷamāna-*, *áheḷayat-* 'not angry, well-disposed', perf. *jihīḷ-*, cf. YAv. *zoiždišta-* 'most dreadful', Gmc. **gaista-* (OHG *geist* 'Geist' etc.), **gaistjan* (OE *gǣstan* 'frighten'), to **gheis-* 'frighten' (IEW 427).

3.1.3 RV *vīḷayati* 'makes strong', *vīḷitá-* 'strong', cf. Av. *voižda(iia)-* 'lift', to **ueih$_x$-* 'pursue; be strong' (IEW 1123-4).

3.1.4 RV (denom.) *nīḷáyati* 'brings together' (cf. *nīḷá-* 'resting-place', Lat. *nīdus* 'nest' etc.)

3.2.1 Ep. + *vrīḍate* 'is ashamed', reflecting either **ur(e)is-d-* (ultimately to **uer-* 'turn'), cf. Gmc. **wraistjan* (OE *wrǣstan* 'twist, wrest' etc.) and perhaps Lat. *rīdeō* 'laugh, smile', or **urik̑-d-*, cf. **ur(e)ik-* in Av. *uruuisiieiti*, causat. *uruuaesaiieiti* 'turn' (see Burrow, BSOAS 17, 343 and Hoffmann, KZ 79, 185).

3.2.2 RV *mṛḷáti, mṛḷáyati* 'pardons' (cf. Av. *mərəždātā* 'be merciful!'), reflecting either **(h₃)mṛĝ-* (cf. RV *mārṣṭi, mṛjánti* 'wipes'), or **mṛs-d-*(cf. RV *mṛṣyte* 'forgets'; Kuiper, AO 12, 258).

3.2.3. Ved. *pīḷayati* 'crushes' (cf. Gk. *piézō* 'id.'), reflecting either ** (e)pi-sd-éie/o-* (to **sed-* 'sit'), or **pis-d-* (cf. Ved. *pinášṭi*, Lat. *pīnsō* 'crush, pound'; Kuiper, op. cit. 227-8).
Several other early forms are too problematic to be adduced here: RV *nédiyan* 'nearer', *nédiṣṭha-* (Av. *nazdišta-*) 'nearest'; RV *krīḷati* (cf. § 1.2 above); Ved. *mīḷati* 'closes the eyes'; other post-Vedic material is similarly difficult (*loḍayati* (Sūtras) 'sets in motion, agitates'; *mreḍ-* (Śrauta-sūtras) 'repeat'; *tāḍáyati* (Ep.+) 'beats'; etc.), or is otherwise unusable (e.g. Schallverba like *kṣveḍati* (also *kṣvedati*) 'whizz, rush, buzz').

4. There is, then, a core of verbal forms with stem final *-d-* that is well-attested in the early language (with relatively frequent cognates in Iranian and elsewhere), in which the *-d-* is phonologically regular (usually reflecting **-s-d-*). Moreover, one can point to certain pervasive morphological (and partly semantic) parallels among these forms. In the Rig Veda and Atharvaveda, one finds *nīḷáyati* (denom. with causative accent), and the causatives *vīḷáyati, áheḷayat-*[5], *pīḷáyati*[6], *mṛḷáyati*. It is noteworthy, finally, that in form, the RV hapax *kūḷayātas* is a subjunctive; this is to be compared with RV *nīḷáyāse* 6.35.2 (also a hapax), *vīḷáyāsi* 8.45.6 (otherwise only the imperative *vīḷáyasvă* 4×), and *mṛḷayati* 10.66.3 (otherwise only imperatives *mṛḷaya, mṛḷayantu*, and the participle *mṛḷayant-*, cf. *áheḷayat-*). Given the partially systematic nature of these facts, one can begin to envisage how an original **kūdáyati* might have been remodelled to *kūḷáyati*. Indeed, the antiquity of many of the *ḍ*-forms within Indic (and perhaps even in Indo-Iranian) could allow one to hypothesize that a form like *kūḍ-* reflects a stem **kuh₂-s(-)d-*, whose **-s-* was at some stage phonetically real, but nevertheless secondary. Given patterns like those outlined above, a formant sequence **-sd-* (or perhaps already **-zdaya-*) could have been abstracted from forms where **-s-* was etymological, either from nominal *es*-stems or *s*-enlarged roots; this element would then have been added to other roots which never had **-s-*, resulting in forms like **kuh₂-sd(-)éie/o-* (or IIr. **kū-ždaya-*)[7] In either case, the retroflex of a form like *kūḷáyati* can to some extent be motivated, which contrasts markedly with the cases discussed by Burrow, for which no explanations of this (or any other) sort are offered. My point here is not so much to revive the **keh₂-u-* etymology for *kūḷáyati* (although it does not deserve the neglect it has received), but rather to insist that a theory of "spontaneous cerebralization" (or spontaneous anything, cf. the well-known problem of spontaneous nasalization) has no real validity without a search for underlying factors of linguistic causation.

Notes

1 According to Kuiper, Santali *kondoram* 'sternum, breastbone, chest (of animals)' may show an infix *-nd-* vis-à-vis Sant. *koṛam*, which may lend some support to the idea that Sant. *koṛam* etc. are native Munda words; but this is not a conclusive argument.

2 Note also Mayrhofer's discussion of spontaneous *-ṇ-* in Skt., Mél Renou 50ff. Burrow takes pains, however, to distinguish his position from that of Mayrhofer (op. cit. 542): "In these examples [Skt. *pāṇí-* 'hand' etc.] Mayrhofer sees the first traces of a tendency which later, in Prakrit, was to turn all

intervocalic dental nasals into cerebrals. Against this view it has to be borne in mind that this change of *-n-* to *-n-* cannot be considered apart from the other cases of a similar spontaneous change in the case of the stops, etc., and that in the case of these there is no general conversion to cerebral in Prakrit."

3 The explanation of Skt. *kundate* (Dhāt. 'dahe') is uncertain, although the form is often said to be an infixed variant of *kūḷayati* (in addition to IEW 571, cf. Wackernagel, Ai. Gr. 1.169). For Kuiper (Turner vol. 1.354), the interpretation of *k(r)ūḍayati* as a loan word "accounts both for the cerebral in a Rigvedic word and for the nasalized variant *kuṇḍate*". If *kūḷayati* is inherited, however, it is not easy to explain *kuṇḍate*. The form may simply be a borrowing, as seems to be the case with most of the Skt. verbal forms in *-uṇḍ-* (e.g. *kúṇḍati* 'is lame, mutilated': Kannada *kuṇṭa* 'cripple', Telugu *kuṇṭi* 'lame'; *cuṇḍáyati* 'cuts off', Tamil *tuṇṭi* 'cut', etc.). Alternatively, if the form shows *-ṇḍ-* < **-nd-* (i.e. is a case of "spontaneous cerebralization", see Burrow, op. cit., 543ff.), *kuṇḍate* (< **kundate*) might show an anit nasal-infix present **ku-né-d-ti* to **keh$_2$-u-*, cf. e.g. **ski-né-d-ti* (Ved. *chinátti*, Lat. *scindō*) to **skeh$_2$-i-* (Ved. *chyáti*, Gk. *skháō*).

4 Only the briefest indications can be provided here; for detailed etymological and morphological discussion, see my Indo-European Verbal Formations in **-d-* (Harv. diss. 1982).

5 Note also the reduplicated aorist *ájihiḷat* (AV 12, 4.8), which supports a causative **heḷáyati*.

6 Note also RV *pipīḷé* 4.22.8, cf. RV *jihīḷa, jihīḷe* etc.

7 The process of such a secondary spread would be comparable to that generally assumed for the origin of IE **-ske/o-* (from **-s-ke/o-*), and also of the more limited **-ste/o-*.

La caractérisation généalogique négative des langues. Quelques enseignements de la linguistique romane.

Ioana Vintilă-Rădulescu

Bucarest

Jouissant de l'avantage de pouvoir confronter les langues actuelles à un ancêtre richement attesté — le latin, la linguistique romane a joué un rôle considérable dans le développement de la méthode comparative-historique. Quelques-uns de ses enseignements s'avèrent applicables également, dans certaines conditions, à l'étude d'autres familles de langues, moins fortunées à cet égard.

L'un des problèmes fondamentaux des études romanes est celui de la classification des langues néolatines — à savoir, de la détermination de leurs traits caractéristiques et, partant, de la position que chacune occupe dans l'ensemble de la Romania. Une question des plus débattues dans ce domaine concerne la place du roumain entre les langues romanes, ainsi que l'individualité de la variété danubienne du latin dont il dérive — qui ont préoccupé aussi bien les linguistes roumains que nombre de linguistes étrangers. Dans ce qui suit nous présenterons quelques remarques relatives au lexique roman, dont nous pensons pouvoir tirer certaines conclusions d'une portée plus générale. Les tentatives de définir le latin danubien, voire le roumain ont conduit les chercheurs à accompagner leur caractérisation positive — relevant la présence de certains traits, conservés pour la plupart — d'une caractérisation négative — réflétant l'absence de certains autres.[1]

Dans le domaine du vocabulaire, le roumain se définit en tant que langue romane par son stock lexical hérité du latin, dont la plupart des éléments se retrouvent dans un ou plusieurs autres idiomes romans. L'héritage latin du roumain comprend un certain
