On 'Thurneysen-Havet's Law' in Latin and Italic

1. Umbrian *sauitu* and related matters

1.1. In a recent paper (2004:622ff.), I proposed an analysis of Umbrian *sauitu* that appealed to the operation, within the history of Umbrian (or earlier), of "Thurneysen-Havet's Law", the phonological process that accounts for the *a*-vocalism of Latin forms like *caueō* 'beware of' [: κοέω 'perceive'] < **kou̯h₁-éi̯o/e-*.[1] Since this is a process for which non-Latin examples had not hitherto been noted, the Umbrian datum has interesting consequences for Italic phonology that deserve to be explored further. I begin by briefly recapitulating the analysis of the Umbrian form, together with other introductory material.

1.2. The famous curse against the enemies of the Umbrian state (Iguvine Tables VIb 60, VIIa 49) consists of five alliterating pairs of 3 sg. imperative ("future imperative") forms; in the VIb 60 version:

tursitu . tremitu [.] hondu . holtu . ninctu . nepitu . sonitu . sauitu . preplotatu . preuilatu

In context, a trio of divinities is asked to perform the actions expressed by these verbs: "[They] shall terrify [them], cause [them] to tremble, …" etc.[2] As is typical for Umbrian, several of the lexical items here are etymologically difficult, including *sauitu*.[3] Still, the form is widely conjectured to have some relationship with Lat. *saucius* 'wounded' (thus von Planta, Buck, Devoto, Pisani, Olzscha, Poultney, Ancillotti-Cerri, among others), e.g. via a pre-Latin **sau̯-ikio-*; and although the background of *saucius* itself [Liv. Andr.+] is entirely unclear

---

[1] The phonetic nature of the process will be discussed below; for the moment, a descriptive characterization such as "pre-Latin **(-)ou̯V-* > Latin *(-)au̯V-*" will suffice. À propos the conventional name: as pointed out by Horton-Smith (1895: 457), it was Saussure, in his *Mémoire,* who first took note of the process as a systematic phenomenon (1879: 104).

[2] On the syntactic irregularity of the singular verb forms with plural subject (vs. VIIa 49, with a single divinity as subject), see my earlier treatment (2004: 615), with further references.

[3] "B[e]d[eutung] unbekannt ... Et[ymologie] ohne B[e]d[eutung]-Bestimmung ungesichert" (Untermann 2000: 658, q.v. for additional bibliographical detail, including material cited below by author's name only).

(Walde-Hofmann s.v.: "unerkl[ärt]"), this formally and semantically attractive comparison offers by far the most promising approach toward interpreting U. *sauitu.* An important step was taken by Ribezzo (1931), who compared the form with Ved. *kṣṇu-* 'whet' (RV *kṣṇaumi*) and Gk. ξύω 'scrape', an immediately appealing comparison for a word (or, including Lat. *saucius,* words) that may mean 'wound' or the like. But serious difficulties are posed by the root vocalism: just as there is no PIE "**sau̯-*" that can underlie Lat. *saucius,* there is no "**ksau̯-*" either – but there is good evidence, as Ribezzo saw, for a verbal root **kseu̯-* (see LIV s.v.): in addition to ξύω, note also Ved. *kṣurá-* 'razor' = ξυρόν 'id.', and (despite LIV, which sets up a separate root **ksneu̯-*) probably also original *n*-infix forms (in addition to RV *kṣṇaumi* also Lat. *nouācula* 'razor').[4] The problem may thus be restated as follows: how can one account in a natural way for the transition from an old **ksou̯-éi̯o/e-* (presumably iterative, 'scrape/wound again and again') to the Italic **(k)sau̯ei̯o/e-* that can underlie U. *sauitu*? My suggestion was that "Thurneysen-Havet's Law" (cf. **1.1.**, **kou̯h₁-éi̯o/e-* > Lat. *cauēre* etc.) provides an immediate and attractive solution, despite the fact that this process had hitherto been established only for Latin.[5] There is, nevertheless, good reason to suspect that this process could have operated outside Latin, given its relative chronology (as discussed in detail by Schrijver): it must precede not only **Vg^uV* and **Vg^uhV* > **Vu̯V,* which must belong to a very early stratum of Latin (hence *foueō* 'warm', not ***faueō*; *nūdus* 'naked',[6] not **naudus,* etc.), but it also precedes **eu̯* > **ou̯* (thus *nouus* 'new', not ***nauus,* etc.),[7] which is often assumed to be an innovation of Proto-Italic date, and which in any event (that is, despite the possible survival of a few *-eu̯-* forms into early Latin) must be considered to be very old.[8] For these reasons, Schrijver concluded

---

[4] On the entire complex, see García Ramón 2000: 121 (including enlarged **ks-en-* and **ks-es-* beside our **ks-eu̯-*, originally to **kes-* 'ordnen': OCS *česati* 'comb' etc.).

[5] For full discussion of Thurneysen-Havet's Law (with earlier references), see Collinge 1985: 193ff., Schrijver 1991: 436ff. (on which see Rasmussen 1993: 200), and Meiser 1998: 85. (Earlier handbook treatments can be found in Sommer 1914: 109, Sommer-Pfister 1997: 159ff., Leumann 1977: 49f.) (See note 57 below for the treatment by Sihler 1995.)

[6] Assuming an *o*-grade source of the traditional type **nog^u-Vd^ho-* (but see Nussbaum 1999: 383, 401).

[7] We will, however, have occasion to reconsider *nouus* below (**3.5.**).

[8] Despite e.g. Leumann 1977: 70f., all of the Lat. *-eu̯-* forms in question (esp. NEVEN CIL I^2 455 [Ardea], NEVNA CIL I^2 2845-6 [Tor Tignosa], Carm. Sal. *Leucesie*) have plausible secondary explanations; references and discussion at Vine 1993: 63n56. As for the probable secondary /eu̯/ diphthongs in the dialectal Latin forms, parallels are not difficult to find: Bruce Hayes points out to me the [ow] > [ɛw] development in some

All use subject to JSTOR Terms and Conditions

his analysis of the chronology of Thurneysen-Havet's Law by observing (1991: 453) that the process "can in principle be very old" and that "No other typically Latin development can as yet be dated before it"; and Meiser (loc. cit. [n. 5]) arrived at the same conclusion, asserting that in theory, the rule is "auch für das Sabellische gültig" – as indeed von Planta had already suspected (1892: 115), without being able to provide any clear-cut examples in Sabellian. Such a view would be confirmed by U. *sauitu,* if it is to be explained on the basis of (a pre-Latin version of) Thurneysen-Havet's Law; and an attractive case from Venetic will be presented below (**4.4.1.**). It is precisely the probable antiquity of the process that is central to the discussion in sections **2.** and following.

1.3. Two possible counterexamples in Sabellian are known to me. The first is U. *anouihimu* (VIb 49, bis; 3 sg. mid. imperative),[9] with a probable meaning 'put on (clothing/insignia etc.)' (cf. Lat. *induō*, Arm. *aganim* 'id.', etc.; LIV s.v. **h*$_2$*eu̯H-*, Untermann 2000: 112f.). Although the form is ambiguous in terms of its inflectional class (it can continue either an *ē*-verb or an *ī*-verb), it could well reflect an iterative-causative **-h*$_2$*ou̯H-éi̯o/e-,* which might have been expected to surface, with an application of Thurneysen-Havet's Law, as †*anauihimu.* This is not, however, a probative counterexample, since the vowel in question appears in a medial syllable (after the preverb). That being the case, the *o*-vocalism could be explained, as suggested by Meiser (2003: 67n113), with recourse to the medial-syllable *a* > *o* rounding process (with adjacent labial) already established for Umbrian (**prehub-** beside **prehab-**, *comoltu* beside **kumaltu**, etc.; Meiser 1986: 268ff.). Nor is original *o*-vocalism a necessary starting point in any case: the form could just as easily continue an *e*-grade *i̯o/e*-verb (**-h*$_2$*éu̯H-i̯o/e-* > pre-U. **-au̯i̯o/e-*), as Meiser assumes.[10]

U. **-tuvitu/***-douitu*, **-tuvies** (together with Fal. *douiad* and OLat. *duim, duat*) will be addressed in **4.4.7.** below.

1.4. Finally, it is worth commenting briefly on some "non-evidence" for Thurneysen-Havet's Law in Umbrian, despite handbook (and other) treatments. Certain Umbrian preforms are often written as if Thurneysen-Havet's Law had operated at some pre-Umbrian stage: thus U. **kutef**, traditionally interpreted to mean 'tacitus' vel sim., as if equi-

---

versions of early 20th-century British Received Pronunciation (Wells 1982: 293f.), as well as the same phenomenon in some American dialects. (No *-eu̯-* forms are attested in Faliscan or Sabellian.)

[9] I am grateful to Michael Weiss for bringing this form to my attention.

[10] Similarly von Planta, Brugmann, Buck and others, see Untermann loc. cit. (where also for still other derivational possibilities, such as denominative formation).

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

valent to a Lat. **cautēns* (and with a formation like Lat. *fa-t-ē-rī,* cf. Osc. **fatíum** 'assert'), is routinely assigned a preform **kau̯(i)-t-ē-* or the like, as if showing a pre-Umbrian application of Thurneysen-Havet's Law (see e.g. Untermann 2000: 422).[11] But in all such forms, the surface monophthong in Umbrian is phonologically ambiguous (thus here **<u>** in principle from Pr.-Ital. **au̯* or **ou̯*), and provides no information at all about the earlier vowel quality.[12]

2. On the apparent Latin exceptions to Thurneysen-Havet's Law

2.1. If Thurneysen-Havet's Law operated at a very early period (as had already been suspected), it becomes important to reexamine previously-identified exceptions – all of them, of course, in Latin. These have been analyzed extensively by Schrijver (cf. n. 5), whose treatment left a small but significant residue of unexplained, ambiguous, or (as it seems to me) unsatisfactorily explained cases. (We will also consider an additional exceptional form, to my knowledge not previously discussed in this connection.)

2.2. The first subtype to be evaluated involves Latin forms with the descriptive appearance of containing an "unshifted" prevocalic *-ou-* diphthong, for which the simplest explanation would appeal to old *e*-grades (therefore not subject to Thurneysen-Havet's Law, cf. **1.2.** *nouus*); thus Schrijver (1991: 451): "*eu̯* rather than *ou̯* is possible for 2. *cloāca,* 7. *mouēre* and 8. *nouācula*". For such explanations to be convincing, it is crucial to provide morphological justification for the *e*-grades. For two of these items (*nouācula* and *cloāca*), Schrijver provides no actual explanation, and his account of the third (*mouēre*) seems problematic. A fourth item (an alleged Lat. †*touēre*), not treated by Schrijver, calls for discussion as well.

2.2.1. Lat. *nouācula* 'razor' [Cic.+] is traditionally understood as an instrument noun to a verb **nouāre* (cf. *gubernāre* 'steer' → *gubernāculum* 'rudder', etc.), ultimately belonging with the root **ksneu̯-* of RV *kṣṇaumi* (**1.2.**); but the source of this **nouāre* is variously described, or sometimes left unspecified. Thus, Ernout-Meillet provide a reconstruction **ksnouā-tlo-* (sic), which (with its pre-Italic **ksn-* and **-tlo-*) seems to assume an inherited *o*-grade; in contrast, Walde-Hofmann cite Kretschmer (1892) as one of the authorities for their *e*-grade **qsneu̯ā-* – and yet Kretschmer himself was non-committal on this

[11] More recently, Untermann 2002: 379n10 ("umbr. **kutef** < **kau-t-ē-ns*").

[12] Likewise U. *fons* 'fauens', often assumed to continue Sab. **fau̯(V)-ni-* (see Untermann 2000: 302), but in fact multiply ambiguous, as Schrijver has discussed (1991: 442).

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

point.[13] As already noted, Schrijver (1991: 449) points out the apparent Thurneysen-Havet's Law violation and the formal ambiguity ("Lat. *nouācula* reflects **ksneu-* or **ksnou-*"), without further comment.

What sort of morphological basis might an *e*-grade formation have in this case? The most immediate possibility – a primary *e*-grade abstract/verbal noun **ksneu̯-eh₂-* (> pre-Lat. **ksneu̯ā-*) – is not at all attractive: no examples of such a type are found in Latin at all, as shown by Livingston (1997: 64) in her analysis of Lat. *praeda* 'booty' (best taken from an *o*-grade **prai̯-hod-ā,* rather than the conventionally-assumed **prai̯-hed-ā*). Nor are such *e*-grade abstracts well-attested elsewhere; thus, the only form in Greek with a claim to archaism is Hom. εὐχή 'prayer, vow', which is better taken as deverbal to εὔχομαι 'pray, vow', according to a productive pattern within Greek.[14]

As a preliminary to an alternative suggestion, we must address a semantic question that seems generally to be ignored: if PIE **ksneu̯-* meant 'whet, sharpen' (its traditional gloss, cf. RV *kṣṇaumi* and its instrument noun *kṣṇótra-* 'whetstone'), why does the instrument noun Lat. *nouācula* mean 'razor' (and not something more like 'whetstone')? The simplest assumption is that the infixed "pseudo-root" **ksneu̯-* (**1.2.**) is better conceived as an iterative version of **kseu̯-,* with a meaning like 'scrape (repeatedly)' – i.e., until sharp (as in Indic) or until smooth (as in Italic).[15]

Thus, as a possible solution to the Thurneysen-Havet's Law problem, I suggest that what may underlie Lat. *nouācula* is a primary *e*-grade thematic adjective **ksneu̯-o-* '(scraped) smooth' of the type **néu̯-o-* 'new', **sén-o-* 'old', and several other such forms. That this type can also be built on verbal roots is evident from examples like **leu̯k-ó-* 'bright' (LIV **leu̯k-* 'hell werden'), **leu̯bʰ-o-* 'dear' (LIV **leu̯bʰ-* 'lieb sein etc.').[16] The more specific morphological claim, then, is that a

---

[13] "Lat. *nouā-cula* ist von einem verloren gegangenen verbum Lat. **nouā-re* 'scheeren' ausgegangen, welchem seinerseits wieder älteres **ksneu-mi* zu grunde gelegen haben wird" (1892: 470); but cf. 1892: 419 on RV *kṣṇaumi*: "... daneben idg. *snov-* oder *snev-* [emph. BV] in lat. *nou-ā-cula* 'schermesser' aus **snouācula*".

[14] Cf. ἀμυχή 'tearing, scratching' ← ἀμύσσω 'tear, scratch', κομιδή 'care' ← κομίζω 'take care of', etc.; Chantraine 1933: 23, Peters 1980: 12f.

[15] On the iterative value of RV *kṣṇaumi,* see García Ramón 2000 (with the reservations expressed by Klein, 2003: 46).

[16] Like **leu̯k-ó-* (λευκός → λεῦκος 'whitefish', λεύκη '(whitish) skin condition; white poplar') probably also **perḱ-ó-* 'striped, speckled' (*περκός → πέρκος 'hawk', πέρκη 'perch') and **dʰeu̯dʰ-ó-* 'yellow, brown' (*τευθός → τεῦθος 'squid'; thus J. Schindler, 1978 lectures, cf. C. de Lamberterie, *CEG* 6 [2001] 151). Note also **h₁reu̯dʰ-o-* 'red', **h₂erĝ-o-* 'bright' (see Rau 1998: 159 for the latter, vs. traditional **h₂u̯rĝ-[r]ó-* > ἀργός, with dissimilation).

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

**ksneu̯-o-* '(scraped) smooth' served as the basis for a factitive in *-eh₂-* **ksneu̯-eh₂-(i̯o/e-)* 'to make smooth (by scraping)', whence a Latin verb **nouāre* and its instrument noun *nouācula* 'razor'.[17]

As an alternative, one could consider a Latin denominative verb **(ks)neu̯āi̯o/e-* based on an *e*-grade neuter noun **ksnéu̯-o-*, of the type seen in **u̯érĝ-o-* 'work' and a series of other forms, in general quite isolated.[18] At bottom, a principled choice between the factitive and denominative options (both based on *e*-grades) may not be possible.

2.2.2. The situation with *clo(u)āca* 'sewer'[19] is in many ways comparable to that of *nouācula* (cf. Schrijver: "*cloāca* reflects **k̂leuH-* or **k̂louH-*" [1991: 448]). The generally-accepted Baltic cognate (Li. [Žem.] *šlavù* 'sweep, clean') has the appearance of a primary *o*-grade present, and is thus not immediately helpful, especially if one wishes to support an old *e*-grade for the Latin form. There seem, in fact, to be two main views about the source of *cloāca*:

(i) it is based on an abstract noun **clouā-* 'Reinigung' (e.g. Rix 1999: 519);

(ii) it is deverbative to a **clouāre* 'reinigen' (e.g. Leumann 1977: 340);

and (though noted neither by Rix nor Leumann) both sources would violate Thurneysen-Havet's Law if the word has an old **-ou̯-* diphthong. To complicate matters, a Lat. *cloāre* 'reinigen' actually exists – attested once, in a gloss (Serv. auct. ad V. *A.* 1.720, *ueteres cloare purgare dixerunt,* explaining the epithet *Cloacina*). This gloss, moreover, is suspiciously similar to the sole attestation of a synonymous verb *cluere* (Plin. *Nat.* 15.119, *cluere enim antiqui purgare dicebant,* explaining *Cluacina*). Rix explains *cloāre* on the basis of an old *o*-grade causative (again with no notice of the Thurneysen-Havet's Law violation); but he properly acknowledges that *cloāre* might be nothing more than "eine Erfindung von Servius' Quelle (wohl Varro)".[20] We may thus return to *cloāca* itself.

Of the two views outlined above about the source of *cloāca*:

---

[17] Such *-eh₂*-factitives (of the type **néu̯-o-* 'new' → *renouāre* 'renew') are productive in Latin. On the type, see recently Jasanoff 2003: 139ff., Tremblay 2003: 153n177; for the related Anatolian material, see Melchert 1997: 132ff.

[18] Thus also **péd-o-* 'track etc.', **i̯éu̯-o-* 'barley', and einzelsprachlich items: Lat. *serum* 'whey', OPr. *kelan* 'wheel', Hitt. *egan* 'ice', and others. (PIE **u̯érdʰ-o-* 'word' [Lat. *uerbum* etc.] is often placed in this category, but may instead continue an original compound **u̯ér[h₁]-dʰh₁-o-*, as discussed by Hackstein [2002: 14].)

[19] See Leumann (1977: 99) on the Latin spelling variation (CLOVACA, *cluaca*).

[20] Similar skepticism about the verb is expressed by Kümmel (LIV s.v. **k̂leu̯H-*).

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

(i) as noted, an old *o*-grade abstract **k̂lou̯-eh₂-* > **clouā-* would violate Thurneysen-Havet's Law; and an *e*-grade abstract **k̂leu̯-eh₂-* faces the same objections as **ksneu̯-eh₂-* (**2.2.1.**);

(ii) in contrast, a Lat. **clouāre* (with factitive meaning) – possibly the same *cloāre* that is actually attested – would be parallel to **(ks)nouāre*; that is, an original *e*-grade thematic adjective **k̂leu̯H-o-* 'clear, clean' would serve as the basis for a factitive **k̂leu̯H-eh₂-(i̯o/e-)* 'make clean', neither of these forms being susceptible to Thurneysen-Havet's Law.

Finally, although the point cannot be pursued here, note that this root makes a primary zero-grade *ro*-adjective, as attested in Celtic (W. *clir* 'clean' < **k̂luH-ro-*), beside the *e*-grade thematic adjective just posited – a pattern that can be paralleled for other such *e*-grade adjectives; thus **k̂leu̯H-o-* : **k̂luH-ró-* like **h₁reu̯dʰ-o-* : **h₁rudʰ-ró-* (ἐρυθρός 'red') and **h₂erĝ-o-* : **h₂r̥ĝ-ró-* (Ved. *ŕjrá-* 'quick'), to which might even be added **kseu̯-o-* : **ksu-ró-* (*kṣurá-*, ξυρόν, **1.2.**), if it could be shown that "**ksneu̯-o-*" (**2.2.1.**) had replaced an earlier **kseu̯-o-* (among other uncertainties affecting this case).

2.2.3. Superficially rather different (though ultimately similar) is Lat. *moueō,* universally regarded as continuing an old *o*-grade causative,[21] even though the blatant violation of Thurneysen-Havet's Law that such a preform would entail (cf. Lat. *caueō,* **1.1.**) is all but ignored in the morphological and etymological literature. An exception is G. Meiser, who provides two suggestions for explaining the violation (1998: 85):

(i) either the /o/ has been restored after the causative *foueō* 'to warm';

(ii) or the unrounding of the /o/ in *moueō* was blocked phonetically, given its position between two labial segments (similarly, according to Meiser, for *bōs, bouem,* another apparent Thurneysen-Havet's Law violation, to be addressed separately below).

Ad (i): the formal resemblance between *moueō* and *foueō* may well have been a factor (as will also appear in another connection, **2.2.4.**); but this is not likely to have been a sufficient cause, especially since *moueō* is partly intransitive (more on this below), and thus functionally distinct from canonical causatives like *foueō.* As for the phonetic explanation (ii): in its favor is the fact that Latin otherwise attests certain rounding processes that operate in similar environments, as in the type *uomō* 'vomit' < **uemō.*[22]

---

[21] Thus Ernout-Meillet, Walde-Hofmann, Leumann 1977: 541, LIV s.v. **mi̯eu̯h₁-* (Zehnder, Kümmel).

[22] The rule that governs this last item, however, is rather more complex than is generally thought, cf. Nussbaum 2003.

More attention has been devoted to the *moueō* problem in the literature on Thurneysen-Havet's Law.[23] Schrijver tentatively suggests that *moueō* continues an "*e*-grade causative" (**mi̯eu̯h$_1$-éi̯o/e-*),[24] comparing Lat. *augēre* 'increase (trans.)', *suādēre* 'urge', *terrēre* 'frighten', *cēuēre* 'wiggle (the hips)', and *merēre* 'be deserving'. But this is a questionable type, as Schrijver himself seems to realize, when he writes that "the formation might not go back to PIE."; indeed, all of the cases he names can involve secondary developments or other explanations: thus, the *e*-grade of *augēre* could be based on its *s*-aorist (*auxī*) (thus LIV); the vocalism of *suādēre* ('urge' < *'sweeten') could be based on **su̯eh$_2$d-u-* 'sweet' (cf. *suāuis*) (thus LIV); *terrēre* can be phonologically regular < **tros-éi̯o/e-* (Nussbaum 1999: 412n87, LIV) or with vocalism after *terror* (< **trés-ōs*) (Nussbaum); *merēre/-ī* 'be deserving' may rather be a stative in **-eh$_1$-* (similarly LIV, Meiser 2003: 91); *cēuēre* has a perfect "*cēuī*" attested only in grammarians, where evidence is also found for thematic inflection as *cēuĕre* (see TLL III: 982.29ff.), and the sole cognate appears to be CS *po-kyjǫ* 'shake (the head)' (cf. LIV s.v. **keh$_1$u̯-*), all of which means that there is too little information available to make a determination as to the morphological basis of *cēuēre*.

There are, however, other morphological possibilities that may help account for *moueō*; but given well-known complexities surrounding the shape of the root itself (conventionally **mi̯eu̯h$_1$-/*mih$_1$u̯-*, as in LIV),[25] as well as difficulties with some of the alleged cognates (especially in Anatolian[26]), these can only be sketched here. Still, such a sketch should suffice to demonstrate that there are reasonable possibilities for explaining Lat. *moueō* on the basis of one or more inherited *e*-grade formations.

The starting point for one such approach is an observation already regarded by Schrijver as potentially important (although he does not pursue the matter): he notes that, given the intransitive usage of *moueō*, the verb "cannot be considered a typical causative" (1991: 449). Indeed, intransitive behavior for *moueō* is extremely well-attested (from the

---

[23] In recent times, note especially Collinge 1985: 194 and, with an extended discussion, Schrijver 1991: 448f., 469.

[24] Thus already Horton-Smith 1895: 452n1 ("*moueō* < **meueō*, cf. ἀμεύσασθαι").

[25] Or perhaps rather **mi̯eh$_1$-u-/*mih$_1$-u-*, as suggested to me by Jay Jasanoff, to whom I am indebted for valuable discussion about the material in this section.

[26] I thank Craig Melchert for helpful guidance about some of the Anatolian material in this section.

All use subject to JSTOR Terms and Conditions

Archaic period on),[27] most frequently, in the infectum, for the present participle and infinitive, and more generally for the perfect (the latter including the idiomatic usage for describing earthquakes: *terra mouit* etc.). I suggest, then, that if this behavior is old, Lat. *moueō* could result from a conflation of two distinct inherited formations, one transitive (the actual causative) and another intransitive.[28] What is normally reconstructed for the PIE verb is a root athematic present (e.g. LIV: **mi̯éu̯h$_1$-ti/*mih$_1$u̯-énti* → thematized Ved. *mínvati* 'pushes'), thus with *e*-grade in strong forms – a formation that could be continued, directly or indirectly, in the Latin intransitive usages. Formally, intransitive *mouēns* (to a thematic **mouĕre*) could continue a thematized **mi̯éu̯h$_1$-e-ti*[29] or (more directly) could result from an athematic **mi̯éu̯h$_1$-ti* (with development as in *uomere* ← **u̯émh$_1$-ti*).[30] Similarly, an old *e*-grade intransitive root aorist **mi̯éu̯h$_1$-t* (with regular replacement in Latin by *u*-perfect **meu̯a-u̯ai̯*) could have ended up directly as the (intrans.) perfect *mōuī,* beside the *e*-grade verbal noun in **-tu- *mi̯éu̯h$_1$-tu-* (> supine *mōtus* 'movement, motion'). Thus, from a historical point of view, the Latin second-conjugation stem "*mouē-*" (with synchronic *o*-vocalism) could reflect a compromise between the stem-formation of an original causative and the vocalism (originally involving one or more *e*-grades) of the inherited intransitive. In such a development, the voice-neutral supine may have played a role (note expressions of the sort *terrae motus* 'earthquake', cf. *terra mouit* above), as well as the formal overlap – apart from the Thurneysen-Havet's Law treatment – in the Latin present participles of both a plain thematic verb (intrans. *mouent-*) and an original causative (†*mauent-*).

A scenario like that just outlined would seem to be unnecessary, in view of the standard claim[31] that intransitive *moueō* is an inner-Latin development, arising from syntactic ellipsis of reflexive pronouns (*sē mouēre* → [Ø] *mouēre,* etc.). This claim is not without its problems: to

---

[27] See e.g. OLD 3b, Ernout-Meillet s.v., TLL VIII: 1546.9ff., Hofmann-Szantyr 1965: 290, Kühner-Stegmann 1966: 92 ("Vorklassisch").

[28] Similarly Bammesberger 1986 on causative **lou̯k-éi̯o/e-* and stative **luk-eh$_1$-* conflated in Lat. *lūcēre* 'shine' (trans. and intrans.). For the intransitive present participle: cf. Watkins 1969: 144 on inherited "mediopassive Bedeutung des Partizips auf *-nt-*" in Latin (*ēuidēns, uehēns,* etc.).

[29] PIE **mi̯-* > Lat. *m-* regularly.

[30] For the intransitive meaning of the original verb, cf. Toch. B *miwaṃ* 'trembles', Hitt. *mūḫḫi/mauszi* 'falls'. (Despite LIV, it is far less certain that Hitt. *mummiya-* 'scatter, fall apart' belongs with the material assigned to **mi̯eu̯h$_1$-*; and even if it does, its formation remains unclear.)

[31] E.g. Hofmann-Szantyr 1965: 34f., following Bendz 1943: 35ff.

All use subject to JSTOR Terms and Conditions

begin with, the few parallels that are generally adduced (e.g. occasional *recipere* = *sē recipere* 'betake oneself, go') have an altogether different textual profile, as compared with the widespread and early intransitive use of *moueō*. The seminal discussion of this pattern by Bendz (who identified this usage for seven verbs, including *moueō,* in the writings of Caelius Aurelianus [5th c. AD]) makes clear that this is essentially a matter of "volks- und fachsprachlichen Gebrauch" (1943: 35),[32] a characterization that would not be easy to defend in the case of intransitive *moueō* in Archaic and Classical Latin. Nevertheless, even if one wishes to accept this theory, it would actually tend to support a "conflation" approach (as above), rather than weaken it. A pattern involving suppression of reflexive pronouns with original transitive verbs (especially verbs of motion, cf. *[sē] recipere*) could help explain the eventual absorption of both the form (synchronic *o*-grade, continuing an older *e*-grade) and function of the old intransitive verb continued indirectly in *moueō,* according to the suggestion outlined above.

Even if one prefers to insist that the only inherited present was a causative **mi̯eu̯h$_1$-éi̯o/e-* (> Lat. †*maueō* by Thurneysen-Havet's Law): the perfect of this causative could have been built from a transitive *s*-aorist **mi̯eu̯h$_1$-s-* with *e*-grade; compare *lūxī* to *lūceō* (n. 28 above), as well as Hittite present forms like 2 sg. *maušta,* perhaps ultimately related to *s*-aorist forms for this root (cf. LIV).[33] In Latin, however, where such an *s*-aorist **mi̯eu̯h$_1$-s-* would develop to **meu̯a-s-,* all vowel-final *s*-aorists were automatically replaced by *u*-perfects, a process that would have resulted in **meu̯a-u̯ai̯* > *mōuī* (again, beside supine *mōtus* with old *e*-grade). Subsequent analogical adjustments could have taken place in different ways, depending on the chronology. Thus, at the stage pres. **mau̯ei̯o/e-* : perf. **meu̯a-u̯ai̯* (: supine **meu̯a-tu-*), the present could have been remade as **meu̯ei̯o/e-,* whence *moueō.* Or, at a later stage: the resulting pattern **maueō/mōuī* (and supine *mōtus* beside verbal adj. **mautus* < **mou̯h$_1$-eto-*[34]) would be highly aberrant, as compared both with Thurneysen-Havet forms like *caueō/cāuī* (*cautus*) with persistent *a*-vocalism and other old causatives (*moneō/monuī/monitus*

[32] Cf. his judgment about *recipere* (1943: 37): "Der intransitive Gebrauch von *recipere* scheint gerade in der Militärsprache besonders beliebt gewesen zu sein".

[33] The comparison between the Greek *s*-aorist ἀμεύσασθαι '(ex)change, surpass' and Lat. *moueō* (often mooted in the etymological literature, cf. n. 24 above) may well be specious, if Wachter's attractive analysis of ἀμεύσασθαι is correct (cf. rather ἀμείβω '(ex)change', replacing *ἀμειϝω; 2001: 119ff., cf. S. Minon, *CEG* 8 [2003] s.v. ἀμείβω).

[34] This verbal adjective might also have been in competition with the original **mi̯uh$_1$-tó-* (> Lat. †*mūtus*), which survives indirectly in Hitt. *mūdāi-* 'remove' (cf. Melchert 1994: 60, with references).

All use subject to JSTOR Terms and Conditions

etc.) with persistent *o*-vocalism; such a pattern would be ripe for adjustment to *moueō/mōuī* (*mōtus*), perhaps with pressure from the phonetically similar causative *foueō/fōuī* (*fōtus*) (cf. above on this point) and, for that matter, the iterative *uoueō/uōuī* (*uōtus*) (neither of which was ever susceptible to Thurneysen-Havet's Law, given their original root-final *-$g^{u h}$-, cf. **1.2.**). Somewhat similarly, Rasmussen (1993: 200) envisages for *moueō* "reintroduction of the vocalism *-o-* in what was still synchronically a causative".

In conclusion: besides analogical influence from *foueō* and purely phonetic factors (Meiser's explanations (i) and (ii) above), there are viable sources for the synchronic *o*-vocalism of *moueō* based on one or more inherited *e*-grades, much as with *nouācula* and *cloāca.*

2.2.4. Similar to *moueō* is an alleged †*toueō,* the existence of which is sometimes conjectured (thus IEW 1080, Walde-Hofmann s.v. *tōtus,* Leumann 1977: 133) on the basis of the following forms:

(i) *tōmentum* 'stuffing (for cushions etc.)' [Varro+], formally parallel to *mōmentum* [Ter.+] (cf. *moueō*) and *fōmentum* '(warm) poultice; alleviation' [Cic.+] (cf. *foueō*), and comparable to other *-mentum* forms built to causative stems (*moneō/monumentum* etc., Leumann loc. cit.);

(ii) the adjective *tōtus* 'all', taken in this view to be the original verbal adjective to †*toueō.*

Despite Walde-Hofmann, the etymology of *tōtus* implied by (ii) is far from secure, and this form is best left out of account here. But even *tōmentum* lends itself to different interpretations. Thus Ernout-Meillet prefer **ton(d)-s-mentum* (to *tondeō* 'shear, clip'),[35] and Perrot (1961: 168 with n. 6) declares that the word "n'a pas d'étymologie sûre", adding evidence suggestive of a borrowing from Gaulish. Nevertheless, the material in (i) is somewhat suggestive of a causative †*toueō* 'stuff', which deserves to be evaluated briefly as a counterexample to the expectation of a Thurneysen-Havet result comparable to *caueō.*

In short, some of the same arguments applied to *moueō* are equally valid for †*toueō,* mutatis mutandis. The etymological basis of the interpretation in question (thus IEW loc. cit., Walde-Hofmann s.v. *tōmentum*) is the root **teu̯h$_2$-* 'swell, become strong' of Ved. *tavīti* 'grows strong' (LIV 639f., without mention of †*toueō*). For this root, M. Kümmel (LIV) plausibly reconstructs an athematic root present **téu̯h$_2$-ti/*tuh$_2$-énti* (cf. *tavīti*), with possible traces of a reduplicated present (in the Ved. aor. inj. 2 sg. *tūtoṣ,* 3 sg. *tūtot*; see Kümmel 2000: 220f.) and a nasal present (in OP *tunuvant-* 'mighty'). Thus, as with

[35] Cf. the entry in CGL II.595.36: 'genus herbae quae pro plumis in lectum mittitur'.

moueō, a corresponding active root aorist **téu̯h₂-t* 'was swollen/strong' (> 'was filled/stuffed') would have been regularly replaced, in Latin, by a *u*-perfect **téu̯a-u̯ai̯* > **tóu̯a-u̯ai̯*[36] > †*tōuī.* Unlike *moueō,* however, an inherited causative **tou̯h₂-éi̯o/e-* 'strengthen, make swollen' (> 'stuff') – if it ever existed – would not necessarily have developed to an *ē*-verb †*taueō* (like *caueō*). Given the Latin *ā*-verbs suspected by some of being original causatives to roots with this structure (i.e. $CeCh_2$-),[37] we might rather expect the result to have been a **tou̯āi̯o/e-* > **tau̯āi̯o/e-* (by Thurneysen-Havet's Law) > †*tauāre,* with perfectum **teu̯a-u̯ai̯* (cf. **dema-u̯ai̯, *su̯ena-u̯ai̯,* etc.) > **tou̯a-u̯ai̯* > †*tōuī.* Especially in that event, the resulting †*tauāre/*†*tōuī* (transitive) beside intrans. perf. †*tōuī* (as above) would have been intolerable; and given the formal and semantic parallel of *mōuī* (both trans. and intrans.),[38] an evident solution would be the creation of a †*toueō,* whence *tōmentum.* Nor is a †*toueō* actually needed to account for Lat. *tōmentum*: a perfect †*tōuī* 'I am/have become stuffed' (inherited from a PIE root aorist or perfect, the latter being the other reconstructable form for this root: cf. LIV on Ved. *tūtā́va,* YAv. *tūtauua*) might have provided a sufficient basis (by analogy to *mōuī/mōmentum, fōuī/fōmentum*) for the creation of a *tōmentum.* In sum, a †*toueō* – which, after all, is entirely unattested – need never have existed at all, and need not in any event reflect an original formation that would serve as a counterexample to Thurneysen-Havet's Law.

2.3. As discussed in more detail below (**4.1.**, **4.3.**), the most widely-accepted version of Thurneysen-Havet's Law restricts the process to */ou̯/ preceding an accented vowel, in terms of the Classical Latin accent (thus *cauḗre, cauḗbam, cauḗbō* etc. would be phonologically regular, with *cáueō, cáuet, cáuē* etc. the result of analogy). For such a theory, root-accented forms with *o*-vocalism – such as *ouis* 'sheep' – are unproblematic. But the considerations bearing on the chronology of Thurneysen-Havet's Law (**1.2.**) already make clear that a formulation based on the Classical Latin accent cannot be correct. It now appears, then, that unshifted forms like *ouis* (and likewise forms of the word for 'cow': gen. *bouis,* acc. *bouem,* etc.) are exceedingly difficult to account

[36] Not subject to Thurneysen-Havet's Law, since *-ou̯-* here results from *-eu̯-* (**1.2.**).

[37] Thus *domāre* (*domuī, domitus*) 'tame', *uetāre,* OLat. *uotāre* (*uetuī, uetitus*) 'forbid', cf. *sonāre* beside *sonere* (*sonuī, sonitus*) 'sound', *tonāre* beside *tonere* (*tonuī, tonitus*) 'thunder'; on the morphological background of such forms see Schrijver 1991: 391ff., Rix 1999: 517ff.

[38] With additional formal pressure perhaps applied by *foueō/fōuī, uoueō/uōuī.*

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

for, just as they were for earlier pre-accentual theories, beginning with the original studies of Thurneysen and Havet themselves.[39]

2.3.1. For *bouis/bouem,* a popular approach (beginning with Thurneysen) appeals to the dialectal status of *bōs*; but if Thurneysen-Havet's Law is as old as it seems to be, this would not be helpful. Still, there is the possibility, already mentioned (**2.2.3.**, ad init.), of a phonological explanation (and a different phonological solution will be proposed below). It seems possible, moreover, that the *o*-vocalism of nom. sg. *bōs* (whether or not that form directly continues PIE *$g^{\mu}o\underset{\sim}{u}s$, on which see Sihler 1995: 335f.) might have exerted sufficient pressure to maintain oblique forms like *bouis* (vs. **bauis*). If, moreover, oblique forms of this word are to be reconstructed with *e*-grade (cf. Sihler 1995: 334f.), such forms (dat. *$g^{\mu}\acute{e}\underset{\sim}{u}$-$ei$ etc.) would not have been susceptible to Thurneysen-Havet's Law in any case.

2.3.2. Much more difficult is *ouis*. The old claim that the word is borrowed from Greek or Sabellian (thus Havet, Horton-Smith, and others) is no longer acceptable. Another hoary explanation asserts that an application of Thurneysen-Havet's Law would produce †*auis,* generating a case of "homonymie fâcheuse" with *auis* 'bird'; but Schrijver properly observes that "if this was the only reason, restoration of *o$\underset{\sim}{u}$* seems unlikely". Schrijver's own approach to *ouis* is as follows. Operating with a reconstruction *$h_3\acute{e}\underset{\sim}{u}$-*i*- (where the initial *h_3e- would seem to predict old *o*-vocalism for Italic), he suggests that the sequence */$h_3e\underset{\sim}{u}$-V-/ (with original old *-*e*-) might still have been phonologically distinct from the ordinary */o/ of the /o$\underset{\sim}{u}$/ diphthong at some stage of Italic, and thus would not have been affected by Thurneysen-Havet's Law. Part of the basis for this suggestion is the Latin version of Rix's Law,[40] showing distinctive coloration for the laryngeals at a stage not long before Italic, as well as a claim by Lubotsky (1990) concerning *h_3e- as phonetically distinct from *-*o*- and **Ho*- in the prehistory of Sanskrit,[41] as a way of accounting for the failure of Brugmann's Law to apply to Ved. *ávi*- 'sheep'.[42]

---

[39] See in detail Schrijver 1991: 436 (general), 447 (*bouis* etc.), 449f. (*ouis*), 453f. (conclusions).

[40] See Schrijver 1991: 56ff., Meiser 1998: 106.

[41] In essence (cf. Lubotsky 1990: 135), applying to Sanskrit a version of Kortlandt's theory (1980: 127f.) that Armenian distinguishes original *h_1o- from *h_3e-. This behavior, however, is far from clearly demonstrated; see Mayrhofer 1986: 141, Olsen 1999: 18n31, 47n95.

[42] Oddly, even though Schrijver (following Lubotsky 1990: 133f.) operates with a preform *$g^{\mu}h_3$-$e\underset{\sim}{u}$- for 'cow', he does not avail himself, in his discussion of that word

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

There are, however, a number of difficulties with this account. To begin with, it seems abundantly clear that the coloring of *h_3e- to *h_3o- must have taken place long before Italic (Meier-Brügger 2003: 112), in which case the distinctiveness of the laryngeals themselves at some stage of Italic (in certain other positions) is beside the point; see the similar argumentation by Rasmussen (1993: 200) against Schrijver's conception ("*theoretically* possible" but "hardly credible"). Nor, as Lubotsky himself admits (1990: 130, 134), does the non-application of Brugmann's Law in Ved. *ávi-* require a claim about initial *h_3e- having been treated differently from old */Ho/ (see more recently Kim 2000: 39n4, with references). Finally, the word for 'sheep' is now better reconstructed as *h_2ó$\underline{u}$-i-, in view of Lycian (acc. sg.) *χawa* (vs. *h_3- > Ø in Lycian).[43] Given, then, the inescapable old *o*-grade of such a form, Lat. *ouis* emerges as the single most intractable exception to Thurneysen-Havet's Law (cf. Meiser [1998: 85]: "Schwierig bleibt *ovis*."). The solution to this problem, as I suggest in the next section, calls for a reformulation of Thurneysen-Havet's Law.

3. An accentual theory of Thurneysen-Havet's Law (I): preliminary remarks

3.1. Let us first recapitulate the chronological conception of Thurneysen-Havet's Law developed in section **1.**, as already surmised by Schrijver and Meiser, and supported by a probable instance of the process in Umbrian: simply put, Thurneysen-Havet's Law is among the oldest innovations assignable to Proto-Italic. Indeed, if *$e\underline{u}$ > *$o\underline{u}$ (which Thurneysen-Havet's Law must precede) is taken to be Proto-Italic, Thurneysen-Havet's Law may be the earliest datable development of Proto-Italic. On the basis of this chronology, then, it is possible to suggest the following face-value interpretation of forms like *caueō* on the one hand beside forms like *ouis* on the other: as a first approximation, we may hypothesize that *Thurneysen-Havet's Law was conditioned by what remained of the PIE mobile accent* (at a very early stage of Italic), *and affected only *o$\underline{u}$ sequences in unaccented syllables.* The following sub-sections explore, in a preliminary way, the consequences of this suggestion for some of the prominent forms and categories mentioned so far.

(1991: 447), of an argument based on an alleged difference between /h_3e$\underline{u}$/ and /o$\underline{u}$/, comparable to his suggestion for 'sheep'.

[43] Kimball 1987, Melchert 1994: 72, Kim 2000: 38n2, Yoshida 2004: 195.

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

3.2. For the canonic cases of the type *caueō* and *faueō,* the process as just described would be regular for the present system of original iterative-causatives, under the assumption that the PIE accentuation of forms like **kou̯h₁-éi̯o/e-* was preserved intact. Similarly, it is reasonable to assume that verbal adjectives like Pr.-Ital. **kou̯-eto-*, even though analogically created within Italic,[44] would have had oxytone accent (thus **kou̯-etó-* > Lat. *cautus* regularly), like the inherited verbal adjectives in **-tó-* on which they are ultimately based. A root-accented perfectum **kóu̯a-u̯ai̯,* of course, would not have undergone Thurneysen-Havet's Law in this formulation; but there is little difficulty in assuming that such a form would have been remodeled to **káu̯a-u̯ai̯* (> Lat. *cāuī*) on the basis of the *a*-vocalism of the infectum and the verbal adjective.[45]

3.3. Essentially the same profile as *caueō* appears in *fauēre* (*fāuī, fautus*) < **g$^{u^h}$ou̯-éi̯o/e-* (following Schrijver [1991: 442] for the root, cf. OCS *gověti* 'worship', Arm. *govem* 'praise').[46] The surprising inscriptional form FOVE = 2 sg. imperative *fauē* (CIL I^2 573; on a Praenestine scraper, late 2nd/early 1st c. BC) is traditionally taken to support the accentual version of Thurneysen-Havet's Law based on the Classical Latin accent (**2.3.**). But the current proposal requires that the form be explained secondarily, for which several options are available. As a non-urban inscriptional hapax from a period that predates Classical orthographic norms, the form may simply be untrustworthy: Schrijver (loc. cit.) suggests the possibility of an error, or a local development of older *fauē.* As an "error", for example: one may imagine a contamination with *fouēre* 'warm' in its sense 'cherish, caress, foster' (well-attested from the time of Cicero).[47] As a local development: one can suggest more specifically that the form could be aligned with the "*uociuos*-Gesetz" (Leumann 1977: 50), according to which OLat. *uaC-* > *uoC-* before accented vowel (OLat. *uocīuos* beside *uacuus* 'empty',

---

[44] On the process, see Jasanoff 2003: 103n30.

[45] Similarly, for perf. *cāuī,* Meiser (2003: 233f.). For the sake of completeness, I mention here the only serious alternative to Thurneysen-Havet's Law, namely the theory of Szemerényi (1951), who posits a rule **ōu̯* > **āu̯* (as in perf. *cāuī* < **kōuī* < **kóu̯a-u̯ai̯,* with *caueō* analogical to *cāuī*). Even if such a rule operated in some forms (though perhaps not in initial syllables, cf. *octāuus* '8th'), there are many weighty objections to this theory; detailed argumentation contra in Schrijver 1991: 437f., Meiser 2003: 233f.

[46] Differently LIV (s.v. **d^{h}eu̯-* 'laufen, eilen'); but the difference in the reconstruction of the initial consonant is immaterial for our purposes.

[47] This seems preferable to the attempt (e.g. Warmington 1940: 202n1) to take FOVE as the imperative of *fouēre* in this sense, with elided *me* and with the following woman's name in -AI taken as a possessive genitive instead of dative ("Caress [me]. [Property] of Lucia Cornelia ...").

All use subject to JSTOR Terms and Conditions

OLat. *uocāre* [cf. Plt. *Cas.* 527 *uocent*] for *uacāre* 'be empty').[48] Under unknown conditions (e.g. dialectally, or with the additional labial environment provided by a following glide), the rule might have been extended to initial *fa(u)-* at a time when *f-* was still bilabial,[49] yielding *fouēre* for original *fauēre.* But just as the *uociuos*-Gesetz, which in its clearest instances produced uncomfortable homophonic clashes (cf. *uocāre* 'call' and *uocāre* 'be empty', hence the Plautine pun cited above), was given up not long after it began to operate, a *fouēre* with the meaning of *fauēre* would not have survived long (cf. *fouēre* 'warm'). If, finally, the form continues something old, it could in principle reflect an original root thematic present *$g^{\text{ʷ}h}$éu̯-o/e-* beside the *o*-grade iterative-causative in *fauēre.*[50] The phonology and orthography of such forms in Latin pose complex problems (see Leumann 1977: 135); if the form had survived into Classical Latin, it might be expected to appear as †*fuere.* But OLat. inscriptional practice of about the same period attests spellings exactly comparable to FOVE, e.g. IOVENT = Cl. *iuuent* (CIL I^2 364; "Faliscan cooks" dedication, no earlier than 150 BC), CONFLOVONT = Cl. *confluunt* (CIL I^2 584.23; Sententia Minuciorum, 117 BC).[51]

3.4. Another old iterative-causative of the type seen in *caueō* and *faueō* may appear in *aueō* 'desire' (not treated in Schrijver's material, but cf. already Horton-Smith 1895: 451f. for this analysis). Although often connected with the root of Ved. *ávati* 'furthers', Lat. *iuuō* 'help' etc. (*$h_2$eu̯H-* or [LIV] *$h_1$eu̯H-*),[52] M. Kümmel (LIV) prefers to assign it to a *$h_2$eu̯-* 'genießen', and specifically to an iterative-causative *$h_2$ou̯-éi̯o/e-* seen also in Ved. (3 sg. imperf.) *ā́vayat* 'ate'. For the Latin

[48] There is no good evidence favoring the reverse formulation (*uoC-* > *uaC-*) proposed by Szemerényi (1989: 81ff., similarly Sihler 1995: 44).

[49] On the probable bilabial value of /f/ in OLat., see e.g. Sturtevant 1940: 163, Maniet 1975: 27; a more skeptical judgment in Allen 1978: 34, followed by Stuart-Smith 2004: 47. It is clear, at any rate, that <f> could be used to spell a bilabial segment, as in the OLat./dialectal preposition AF 'ab' (Vine 1993: 175ff.) and Pael. *af-* (voiced bilabial fricative, see Stuart-Smith 2004: 120), and that Lat. /f/ was likely to have had bilabial variants (thus Stuart-Smith).

[50] A nearly identical attestation pattern is found with the other class of Latin *ē*-verbs (i.e. statives), in the type OLat. *fulgere* vs. later *fulgēre* 'shine' (Leumann 1977: 544).

[51] Such OLat. forms themselves are not problematic for Thurneysen-Havet's Law, as they may go back to *e*-grades in some cases, and in others may merely involve hypercorrect spellings (as I hope to discuss elsewhere). Several Lat. *fau-* and *fou-* forms of uncertain etymology (and in some cases unclear meaning) are of no value for the discussion (despite their having figured, sometimes prominently, in earlier work on the problem), and need not be considered here: see Schrijver's comments on *fauis(s)ae, Favonius, Fouii/Faui, fauus, fouea.* For *fauīlla,* however, see **5.** below.

[52] See Schrijver 1991: 47 for etymological discussion and references.

vocalism, Kümmel (ad loc.) writes: "Mit analog. R(e) oder mit lat. Übergang *ou̯ > au̯?" In view of the above discussion of *e*-grade iterative-causatives (**2.2.3.**), the latter interpretation (which works equally well whether one operates with *$h_2$ou̯H-éi̯o/e-, *$h_1$ou̯H-éi̯o/e-, or *$h_2$ou̯-éi̯o/e-) is to be preferred.

3.5. Note that in this revised formulation of Thurneysen-Havet's Law, *nouus* itself (cf. **1.2.**) is not so clearly probative, since a root-accented Italic *nóu̯o- (< PIE *néu̯-o-) would not have been subject to the process (even if Thurneysen-Havet's Law had operated on the outcome of PIE *-eu̯- > Ital. *-ou̯-), and thus might be expected to remain intact in any case. But an easy substitute is available, namely Lat. *nouitās,* which, in view of Gk. νεότητ-, is likely to be an inherited item (**neu̯ó-teh$_2$t-*) that would not have had root accent.[53] The same function could be performed as well by the factitive *renouāre* (n. 17 above), cf. further *nouācula* and *clouāca* (**2.2.1.**, **2.2.2.**). A possible non-Latin example of this sort would be SPi. **súhúh** (TE 1) (< abl. sg. **sou̯ó̯d,* to **seu̯ó-* 'self's, own'; accentuation as in Hom. ἑός 'id.').

3.6. To return to Lat. *ouis*: an important consideration is that the form goes back to an acrostatic *i*-stem,[54] therefore with *$h_2$óu̯-i- in strong forms (e.g. nom. sg. *$h_2$óu̯-i-s > Lat. *ouis* regularly, without application of Thurneysen-Havet's Law), and *$h_2$éu̯-i- in weak forms (> Lat. †*aui-*). Thus, insofar as a homonymic clash with *aui-* 'bird' might have been involved, this could have been responsible for the generalization of the strong stem-form *oui-,* even though Latin may show a tendency to generalize the weak stem in *o/e*-acrostatic paradigms: thus e.g. *pēs* 'foot' (**pód-/*péd-*), *genū* 'knee' (**ĝón-u-/*ĝén-u-*); in contrast, however, *nox* 'night' (**nóg^{u}-t-/*nég^{u}-t-*), with strong form generalized.

3.7. As for 'cow': *o*-vocalism, with no application of Thurneysen-Havet's Law, would again be the regular result for all forms that either retained or developed root accent in the early stage of Italic under consideration. Thus acc. sg. (*g^{u}ṓm →) *g^{u}óu̯-m̥, nom. pl. *g^{u}óu̯-es,* gen. pl. *g^{u}óu̯-ōm* would all have retained *o*-vocalism regularly.[55] The Italic accentuation of gen. sg. (*g^{u}óu̯-s or *g^{u}éu̯-s →) *g^{u}ou̯-os* and dat.

---

[53] For the accentuation of such formations, cf. Ved. *devátāt-* 'divinity', etc. (The medial vowel weakening in *nouitās,* of course, arises at a much later period.)

[54] On the acrostatic inflection, see Kim 2000 (especially on Toch. B *ā$_{\text{u}}$w,* pl. *awi* 'ewe', based on the oblique stem *$h_2$éu̯-i-), with earlier references, and Yoshida 2004 (especially on Lyc. *χawa-*).

[55] If Sihler (1995: 334ff.) is correct in reconstructing *o/e*-acrostatic inflection for this word, original *e*-grade forms might have been leveled out in Greek and Latin in favor of the strong stem, as he notes: thus gen. sg. *g^{u}éu̯-s → pre-Lat./pre-Gk. *g^{u}ou̯-os,* etc. But cf. **2.3.1.**, ad fin.

sg. (?*g^{u}*é̯u̯-e̯i̯* →) *g^{u}*o̯u̯-e̯i̯* is perhaps less clear; but if root accent was not original, it would easily have been acquired by analogy to the rest of the paradigm.

4. An accentual theory of Thurneysen-Havet's Law (II): further considerations

4.1. As already noted briefly (**2.3.**), the proposal outlined in section **3.** does not constitute the first accentual theory of Thurneysen-Havet's Law. An earlier version, based on the Classical Latin accent, was suggested independently by Kretschmer and Solmsen,[56] and that theory remains the standard one either advocated outright or given pride of place in most handbooks of Latin historical grammar.[57] According to this version, Thurneysen-Havet's Law operated only on pretonic syllables (i.e. on the /o/ of sequences /oṷV́/), in terms of the Classical Latin penultimate accent – hence *óuis* with no application, as opposed to pretonic *auíllus* 'agnus recentis partus' (P.F. 13.14L [14M]), and *fóueō* 'warm' with no application, as opposed to *fauílla* 'ashes, embers'. But the probable age of Thurneysen-Havet's Law (as discussed above) is incompatible with such a formulation: the process is far older than any period close to the development of the penultimate stress system of Classical Latin. Moreover, some of the key examples must be interpreted differently, as already seen for *foueō* (**1.2.**): the non-application of Thurneysen-Havet's Law in *foueō* (< *$d^{h}og^{uh}$*-é̯i̯o/e-*), with the same iterative-causative formation as *caueō* and *faueō,* is better explained by the assumption that the process did not affect the outcome of *-og^{uh}*V-* > *-o̯u̯V-*; and therefore, if the *a*-vocalism of *fauílla* arises from Thurneysen-Havet's Law, the word would have nothing at all to do with *foueō,* as discussed below (**5.**).

There is, however, an attractive and important feature of the Kretschmer-Solmsen theory that remains intact in the above formulation – namely, the phonetic and typological naturalness of vowel-quality neutralizations in unstressed syllables (see recently Flemming 2005, with further references). This includes, to be sure, pretonic unrounding, but also, in principle, posttonic unrounding, as in Modern Russian, where such effects (e.g. nom./acc. sg. *okno* [aknó], gen. pl.

---

[56] References and discussion in Collinge (n. 5 above) and Schrijver (1991: 436ff., 451f.).

[57] See e.g. Sommer 1914: 109, Sommer-Pfister 1977: 159ff., Leumann 1977: 49f. (with the accentual conditioning mistakenly attributed to Thurneysen and Havet). An exception is Sihler (1995: 44), with a very loose formulation without reference to accent ("*ov* (of any origin) sporadically becomes *av*").

okon [ókən] 'window(s)', etc.) belong to the broader syndrome of vowel reduction (i.e., neutralization of vowel quality) in unstressed syllables. Parallels involving the glide environment can also be found. Thus, in early Old Irish (8th c.+), an /o̯u̯/ > /au̯/ process in accented syllables shows the same (descriptively dissimilatory) unrounding.[58] Similarly, in British Celtic, there is evidence for a development of Primitive British *-*o̯u̯*- to Middle Welsh *-aw-*, apparently restricted to Late Prim. Br. penultimate syllables and possibly conditioned by the vowel quality in the onset of the following syllable (see Schrijver 1995: 336ff.).[59] Despite the difference in the accentual conditions, these patterns share an important feature with Thurneysen-Havet's Law, in terms of their syllable structure. In all of these "/o̯u̯/ > /au̯/" processes, the glide is followed by a vowel, and thus the *-*o*- and the glide are heterosyllabic (thus /o$u̯V/ > /a$u̯V/, where "$" denotes syllable boundary).

This configuration should be considered together with two other factors, the first of which arises from the nature of rounding itself. In a recent analysis of the typology of rounding harmony, Kaun (2004) has surveyed the phonetic properties of rounded vowels, summarizing recent studies that describe their articulatory, acoustic, and perceptual features. From all of these perspectives, it emerges that the manifestations of rounding are nonuniform with respect to vowel quality distinctions (i.e., in terms of tongue position). Most important for our purposes are correlations with vowel height, including the following observations: in terms of articulation, the magnitude of lip rounding tends to be relatively greater for high vowels than for nonhigh vowels; in terms of vowel acoustics, lip rounding "has more dramatic acoustic consequences for high vowels than for mid vowels" (Stevens 1998: 294); and in terms of perception, nonhigh vowels tend to be perceived as relatively less rounded than high vowels. It is reasonable to assume that these correlations could well have been operative with respect to the PIE and Proto-Italic mid rounded **o* as opposed to the glide **u̯* (the non-syllabic counterpart of high rounded **u*).

The further consideration that the spread of phonetic features is inhibited by syllable boundary means that any rounding effect of /u̯/ on /o/ in heterosyllabic /o$u̯V/ would ordinarily be weaker than in tautosyllabic /o̯u̯$/. Given, then, the typological facts about the

---

[58] E.g. OIr. *naue* 'new' (Sg. 5[b]6.217), vs. Gaul. *Neuio-/Nouio-* etc. (Thurneysen 1946: 45f.).

[59] E.g. MW *llawer* 'large number, many', vs. MCo. *lower, lowr* 'many; enough', cf. OIr. *loor, lour* 'enough, sufficient' < Prim. Ir. **lo̯u̯ero-* < **ro-u̯er-o-* (cf. OIr. *ro·fera* 'is sufficient').

All use subject to JSTOR Terms and Conditions

relatively weaker rounding of mid vowels as compared with high vowels, the rounding of /o/ in heterosyllabic /o$u̯V/ may in some languages be relatively unstable. Pressure towards unrounding of /o/ in this position might also be enhanced if the /o/ is unaccented, since rounding gestures in shorter vowels would be less complete (and unaccented vowels tend to be shorter than accented ones). Thus, for example, the rounding in accented /ó$u̯V/ (cf. Pr.-Ital. **óu̯i-* < PIE **h₂óu̯-i-* 'sheep') is "protected", so to speak, by the accent, as opposed to unaccented /o$u̯V/.[60] If the contrast between relatively unrounded /o/ in /o$u̯V/ and more rounded /o/ in /ó$u̯V/ becomes phonologized, the result would be what appears, on the surface, to be a "dissimilatory unrounding" of /o/ followed by the glide /u̯/, but which may instead have more to do with the phonetic typology of rounded vowels and with feature-spreading behavior with respect to syllable boundary.[61]

These hypotheses are also of interest when viewed from a historical perspective. To consider a form like *caueō*: the essential difference between PIE */kou̯$h₁éi̯e-/ and Pr.-Ital. */ko$u̯éi̯e-/ is the shift in syllable structure from tautosyllabic /ou̯$/ to heterosyllabic /o$u̯/, as a consequence of the loss of the prevocalic laryngeal. One could theorize, then, that the Thurneysen-Havet /o/ > /a/ "effect" is in some way related to the dramatically increased frequency of morphemes, in Proto-Italic, with "unprotected" /o/ (before labial glide) in heterosyllabic position. Indeed, as we will see, many Thurneysen-Havet forms involve just such a background, with root-final laryngeal lost before vowel in Proto-Italic.[62]

4.2. The present model, then, represents a "modified Kretschmer-Solmsen theory", based not on the Classical Latin penultimate accent, but on the remains of the PIE mobile accent at some early stage of Italic. Note further that the proposed formulation, for reasons that will become apparent below, operates more broadly with a structural

---

[60] Compare, in English, the contrast between /o/ under primary stress in the adjective *thrówaway* (always realized as [o]) and /o/ preceded or followed by primary stress, respectively, in *Génoa* and *Hallowéen,* where realization with schwa is normal in casual speech.

[61] As for the precise mechanism that might account for the phonologization of this rule (a topic that cannot be explored here): this would depend on one's views about historical phonological theory; several current approaches are conveniently surveyed by Stuart-Smith (2004: 8ff).

[62] I am extremely grateful to Adam Albright (MIT) and Bruce Hayes (UCLA) for discussion and references connected with the phonetic and phonological treatment in this section.

description of the rule that allows for the /o/ of any unaccented syllable to be affected, and not just /o/ in pretonic syllables.

The general approach that underlies this model rests on two main assumptions, neither of which seems difficult.

4.2.1. The first is simply that some remnant of the IE system of mobile accent survived into an early stage of Proto-Italic, before the well-known (and later) period of initial stress that characterizes both pre-Latin and the prehistory of the Sabellian languages (as well as Etruscan, during part of its recorded history). If this assumption is correct, Italic would be roughly comparable to Germanic, and Thurneysen-Havet's Law would have a status similar to Verner's Law, with the exception that – for evident reasons, such as the prevalence of subsequent syncope rules and monophthongizations in a large part of Sabellian, and to a certain extent also in Latino-Faliscan – there are far fewer visible traces of Thurneysen-Havet's Law in Italic (and especially in Sabellian) than there are of Verner's Law in Germanic (and, partly as a consequence, no systematic exploitation of the process in grammatical categories.) Still, if this general picture is correct, Thurneysen-Havet's Law would provide a valuable window onto the state of the PIE accent in Italic for a number of individual forms and morphological categories.

Here it can be mentioned, in passing, that the system of mobile accent that survived into early Italic need not have involved the same pitch-based system normally reconstructed for PIE itself. On typological grounds, given the nature of the vowel-quality neutralization rule being proposed, it is rather more likely that the accentual system in question already involved a mobile stress accent, roughly as in Modern Russian (as compared with Proto-Slavic), rather than a pitch accent.

4.2.2. The second major assumption is that traces of this surviving mobile system might well be preserved in Latin. Indeed, more than one claim about such traces already exists. Perhaps the best known of these asserts that some Latin prehistoric sequences of the shape CaRaC go back to root-stressed sequences C$\acute{R}$HC, as opposed to the development of unaccented C$\breve{R}$HC to CRāC.[63] Thus Lat. *palma* 'palm, hand' would result from a syncopated **palamā* < (root-accented) **pl̥$\acute{h}_2$-meh$_2$* (cf. Gk. παλάμη 'id.'),[64] vs. the regular unaccented treatment in *plānus* 'flat' < **pl̥h$_2$-nó-*. Another proposal of this sort (Rix 1996: 158n7) concerns the treatment of short vowels in open final syllables, as in *et* 'and' < **éti*

[63] For data, earlier references, and discussion, see e.g. Schrijver 1991: 193ff. (contra), Meiser 1998: 108f. (pro).

[64] The same pattern for Greek is widely accepted (including παλάμη itself), see e.g. Rix 1992: 73; a dissenting view in Sihler 1995: 107f.

All use subject to JSTOR Terms and Conditions

(with apocope of the unaccented final vowel, just as in the active primary endings of verbs), as opposed to ablative singular *pede,* from locative singular **ped-í,* with the originally-accented final short **-í* preserved on the surface (with altered quality); this final vowel is then generalized to other categories where the locative singular would not have been accented – hence *genus* 'race, kind' with abl. sg. *genere* (< **ĝénh$_1$-es-i*) for predicted †*genis,* etc. This pattern has been discussed by Meiser (1998: 74), who observes: "Das Lautgesetz ist insofern bemerkenswert, weil es als einziges spezifisch italisches auf die Akzentuierung vor der gemeinitalischen Festlegung auf den Initialakzent ... verweist."

Neither of these two claims is necessarily correct (a subject too complex to explore here); but both are defensible, and in some respects attractive. The current proposal, then, is that Thurneysen-Havet's Law may provide another such example pointing to the possibility of reconstructing some features of a Proto-Italic mobile accent.

4.3. The original version of the Kretschmer-Solmsen theory entailed another serious problem, apart from the one already noted having to do with relative chronology. Under that theory, there were in fact many direct counterexamples of both types – that is, root-accented forms with *a*-vocalism suspected of deriving from old *o*-grades (as in *láuere, cáuus,* etc.), and pretonic forms that failed to undergo the process (as in *mouḗre, fouḗre,* etc.). Naturally, this required an extensive set of claims about analogical reshuffling – indeed, such a vast amount of essentially arbitrary reshuffling that, as Schrijver has made particularly clear (1991: 437 and passim in his discussion), a theory operating with the Classical Latin accent cannot possibly explain how so many counterexamples of the types involved arose in such a short time. For the "modified Kretschmer-Solmsen theory" under consideration here, operating at the level of Proto-Italic, some of the very same counterexamples inevitably surface. In general, however, analogical reshufflings – and, it is hoped, of a less arbitrary nature – can be countenanced with rather less difficulty, given the much greater time depth involved.

4.4. A thorough descriptive treatment of all the forms that might be relevant for an assessment of this theory is hardly necessary (even if it were feasible within the scope of an article), especially since most of them have been discussed in detail by Schrijver.[65] It is nevertheless

[65] Not all of his analyses are equally convincing; thus, for forms that need not be assessed in detail here: if *caudex* 'tree trunk' belongs with the 'hew' root, Schrijver's

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

appropriate to offer a preliminary sifting of some of the most suggestive material for the theory – as well as some problematic data – in addition to the items already treated above.

4.4.1. Of the gloss *aububulcus* 'pastor bouum' (CGL V.346.39), Schrijver writes (1991: 439) that whether it contains *au-* < **ou̯i-* is extremely uncertain, given the corrupt nature of the gloss, the fact that the word is given a meaning 'cow-herd', and the lack of evidence in Latin for dvandva compounds of this type ('sheep-/cow-herd'). The second point, however, has little merit: the meaning provided by the glossator or adjusted by a subsequent copyist may be affected by the textual history of the glossed word, which at some point in the tradition may no longer have been understood. The final objection is more weighty (although Lindner [2002: 219] seems prepared to accept such a compound for Latin, comparing Gk. ἱπποβουκόλος for the type[66]). Nevertheless, Bährens' attractive correction *au[bu]bulcus* 'pastor [b]ou<i>um' (i.e., *aubulcus* 'pastor ouium') provides an elegant solution to all difficulties (see already Horton-Smith 1895: 453, with earlier references, and especially Saussure 1879: 104). The only supplementary assumption needed, under the current hypothesis, is that when the original compound with **oui-* was formed (cf. *bubulcus* 'cow-herd' and *subulcus* 'swine-herd'; Lindner 2002: 218f.), the first member of such a compound was unaccented. While there can be no independent confirmation of this from Latin, comparative evidence certainly favors such a claim, whatever the precise background of the obscure element *-bulcus*: cf. βουκόλος 'cow-herd', αἰπόλος 'goat-herd' (both paroxytone, instead of oxytone, by Wheeler's Law), ὑφορβός 'swine-herd', Ved. *avi-pālá-* 'shepherd' (also *aja-pālá* 'goat-herd', *go-pālá* 'cow-herd'), *go-pā́-* 'protecting' (< *'cow-herding').

In the securely-attested type of Latin dvandva, the compound members precede a derivational suffix, e.g. *strūfer(c)tārius* 'priest in charge of the *strues* and *fer(c)tum* [sacred cakes]' (Leumann 1977: 403, Lindner 2002: 24, 91). If Italic followed the normal suffix-accent pattern of dvandva-accentuation in Sanskrit (cf. Ved. *ajāváyaḥ* 'goats and sheep'), the medial *-oui-* (for expected †*-aui-*) in the famous three-

---

**kou̯h$_2$d^h-ek-* (> pre-Lat. **kau̯adek-* by Thurneysen-Havet's Law, 1991: 287) would violate Saussure's (laryngeal-loss) Law; the root was of the "long-diphthong" type (LIV 2. **keh$_2$u̯-*), so that an original **keh$_2$u-d-* is equally possible (Vine 1982: 75f.). Or: despite Schrijver (1991: 446), there is little reason to suspect original *o*-grades in *pauīre* 'beat' and *pauēre* 'be struck with fear' (see Hackstein 1993: 154, 161); etc.

[66] On the interpretation of ἱπποβουκόλος [Soph., Eur.] (probably 'Pferdehüter'): Panagl 1999: 442.

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

part dvandva *suouitaurīlia* 'sacrifice of a pig, sheep, and bull' would be an analogical restoration after simplex *ouis* – and a trivial (perhaps virtually automatic) one, the status of sheep in this sacral term (and in the ceremonies to which it belongs) being quite clear. Adjectives of the sort *ouillus* (**4.3.**), *ouīnus, ouīlis,* involving productive formations, could likewise show analogical restorations after *ouis,* even though original oxytone affixes (such as adjectival **-nó-* in *ouīnus*) might well have been preserved as such at the stage of Proto-Italic in question.

A somewhat more complex picture appears in *ōpiliō* 'shepherd' [Plt., Cato+],[67] beside the variant *ūpiliō* (e.g. V. *E.* 10.19); the latter is now generally assumed to be the "urban" variant, and the former "rustic" (see Leumann 1977: 134, following Ernout 1909: 46, 209, cf. 1905/6: 329f.), both somehow involving *oui-* as the first member of an old compound. If this is so, however, the otherwise difficult alternation *ō-/ū-* could be interpreted naturally by assuming that *ōpiliō* reflects a dialectal development of an original **aupiliō* (< **au̯i-p*°),[68] while the "urban" variant *ūpiliō* is the regular result of a version with restored first member **ou̯i-,* as in *ouillus* etc. above.[69] In order to justify the application of Thurneysen-Havet's Law in **aupiliō,* we must consider the formation of the compound, which the *communis opinio* takes to contain a second member related to Lat. *pellō* 'push, strike', hence originally 'Schaftreiber' (see Walde-Hofmann s.v. and Gaide 1988: 210f., with references). If that is correct, the thematic (post-syncope and post-vowel-weakening) **aupilo-* on which the Lat. masc. *-iō* formation could be based (see Leumann 1977: 365) could itself go back to a **ou̯i-pol-ó-* (< **h₂ou̯i-polh₂-ó-*) 'sheep-driving' (for the accent, cf. again *avi-pā́lá-*,[70] ὑφορβός etc. above). Alternatively, given forms like Ved. *go-pā́-* (above), Arm. *hoviw* 'shepherd' < **h₂ou̯i-péh₂-*,[71] one could also imagine a source of the type **h₂ou̯i-ph₂-ló-* 'sheep-protecting' (see next paragraph on oxytone **-ló-*).[72] In either case, the unaccented first member would condition a regular application of Thurneysen-Havet's Law. It is convenient to note, at this point, that a Venetic example of the **h₂ou̯i-polh₂-ó-* type (except with the Thurneysen-Havet form as the second member) may appear in the personal name *ho.s.tihauo.s.,* if one

All use subject to JSTOR Terms and Conditions

accepts Watkins' attractive etymological interpretation *$g^{h}osti$-$g^{h}o\underset{\frown}{u}$ó- 'who honors guests' (1995: 246 with n. 14; cf. Prosdocimi 1978: 265 on *-$o\underset{\frown}{u}$- > -$a\underset{\frown}{u}$- in Venetic, though the example discussed there [theonym *Plavis*] is considerably less certain). The importance of a Venetic example for the chronology of Thurneysen-Havet's Law is evident (cf. **1.2.** ad fin.).

As for *avillus* (**4.1.**): Schrijver (1991: 438f.) has added additional arguments to the earlier view (acknowledged already by Horton-Smith 1895: 453) that the word might in fact continue *$ag^{\mu}n$-*elo*- (thus based not on the word for 'sheep' but rather on the word for 'lamb', as might be expected in view of its meaning and gender). If this is correct, the alternation between *ouis* and *auillus,* one of the cornerstones of the Kretschmer-Solmsen theory, becomes entirely specious. If, however, one assumes that the original diminutive formation of the word for 'sheep' involved an oxytone *-*ló*- that survived as such into Italic, then the resulting *$a\underset{\frown}{u}i$-*ló*- (< Transponat *$h_2o\underset{\frown}{u}i$-*ló*-) could have served as the basis for a double diminutive (formed with *-*elo*-, as usual in Latin) that would yield *auillus* regularly. To be sure, the PIE status of diminutive *l*-formations is a matter of debate; see recently Schuhmann 2003, who argues against a PIE diminutive formant *-*lo*- as such. But even if such diminutives arose independently in Italic (as elsewhere), the unmarked assumption is that their source would be the familiar adjectival *-*ló*-, which (like *-*ró*-, *-*nó*-, and other such thematic suffixes) was normally oxytone: cf. RV *vṛ́ṣalá*- (X.34.11d) 'poor fellow' (: *vṛ́ṣan*- 'man') (Wackernagel-Debrunner 862f., with many more examples, mostly oxytone).

4.4.2. Lat. *cauus* 'hollow' [Cato+] has always been taken to be a Thurneysen-Havet's Law form, with an original *o*-grade (*$\hat{k}o\underset{\frown}{u}H$-*o*-, to *$\hat{k}e\underset{\frown}{u}H$- 'swell', with derived words for 'vault, hole', etc.), comparable to the Greek forms attested in the glosses κόοι· κοιλώματα, κόοι· τὰ χάσματα τῆς γῆς (Hsch.). Lat. *cauus,* however, was a prime counterexample to the Kretschmer-Solmsen theory (**4.3.**), and if the Greek material accurately indicates the original position of the accent,[73] *cauus* remains, at first sight, a prime counterexample for the present theory as well.[74] But it may be significant that these Greek forms have substan-

[73] That is, insofar as the notation of accent in the MSS of Hesychius (notoriously insecure in this regard) can be trusted.

[74] Schrijver, in his analysis of *ouis* (1991: 450), briefly entertained the possibility that the /o/ of *ouis* and the /a/ of iterative-causatives like *caueō* could in theory be accounted for on the basis of the PIE accent; but he rejected this approach precisely because of its

tival meanings: thus, if the accent is taken at face value, root-accented κόοι can simply reflect the regular Greek accent-retraction that often accompanies substantivizations derived from original oxytone adjectives (in the present instance *κο(ϝ)ός).[75] In that case, the adjective itself could well have been a "τομός form" *$\hat{k}$o$\underset{\cup}{\text{u}}$H-ó- 'swelling', the Italic reflex of which (according to the present theory) would therefore be subject to Thurneysen-Havet's Law and develop regularly as Lat. *cauus*. Or, to view the matter somewhat differently (but with the same result): κόοι could show the τόμος form beside the adjectival τομός form on which Lat. *cauus* itself is based. It would in any case be extremely interesting if Latin could be shown to be a language that enables us to distinguish between τόμος and τομός forms – at least in some cases – on the basis of the application (or not) of Thurneysen-Havet's Law, a possibility to be considered further in the next two subsections.[76]

Even if one wished to insist on an original root-accented *o*-grade *$\hat{k}$ó$\underset{\cup}{\text{u}}$H-o-*, analogical sources for the *a*-vocalism of *cauus* are conceivable, such as remodeling after the factitive *ka$\underset{\cup}{\text{u}}\underset{\cdot}{\text{ā}}i\underset{\cdot}{\text{ó}}$/é- > *cauāre* [Varro+]. As for *cauerna* 'hollow, grotto' [Varro, Cic.+]: given the probable Etruscan source and relatively late date of the Lat. *-erna* formations (see e.g. Leumann 1977: 322), the word could simply have been formed on the basis of the already-existing *ka$\underset{\cup}{\text{u}}$o- that appears in *cauus*.

A special problem concerns a series of surprising *o*-grade forms in Ibero-Romance (e.g. Port. *côvo* 'concave, hollow, deep', *cova* 'pit, cavity, hole', Span. *cueva* 'cave', Cat. *cova* 'id.'; Meyer-Lübke 1935: 173), which cannot derive directly from Lat. *cauus*. Under previous conceptions of Thurneysen-Havet's Law, it has been difficult to account for these forms in any reasonable way; especially unsatisfying was the view of these forms as outlying survivors that somehow escaped the operation of the sound law (see Schrijver's critique of this position [1991: 440], building on Solmsen). Under the present theory, however, they could readily be explained as relics of root-accented by-forms, such as the τόμος form *$\hat{k}$ó$\underset{\cup}{\text{u}}$H-o- (cf. κόοι), beside the more widespread τομός form that underlies *cauus*. Alternatively, in view of

---

apparent inability to explain *cauus*, on the assumption that κόοι shows the original accent.

[75] Several examples of this process appeared in n. 16 above.

[76] For recent discussions of τόμος and τομός forms, see especially Krasukhin 2004 and García Ramón 2004: 145ff. (the latter including Latin material: accentually ambiguous *sulcus* 'furrow' beside Gk. ὀλκός 'id.').

the substantival meaning and formation of the better-attested feminines (Port. *cova,* Span. *cueva,* etc.), these forms could point to an original substantive **ḱóu̯H-eh₂,* derived by accent-retraction (cf. above for this derivational pattern in Greek, and **4.2.2.** for the possible retracted accent in Lat. *palma*). In this event, adjectival *o*-grade forms like Port. *côvo* would show trivial analogical remodeling based on this substantive.

4.4.3. Another apparent counterexample is *rauus* 'hoarse' (P.F. 355.3L [283M]), which may well belong with the **h₃reu̯H-* of Ved. *ruváti* 'roars' etc. (Schrijver 1991: 258, cf. LIV **h₃reu̯H-*). An evident solution, in view of the above discussion, would begin from an original τομός form **h₃rou̯H-ó-* *'roaring', as would be semantically attractive in any case. The parallel abstract *rauis* [Plt.+] 'hoarseness' could not derive from an old root-accented **h₃róu̯H-i-* directly; but if such a form was inherited (> **rou̯i-*), it could have been remodeled after thematic **rau̯o-*. Alternatively, and perhaps most likely, the abstract could have been formed within Italic beside **rau̯o-* (thus Nussbaum 2004: §4.2.2), given the profusion of such *i*-abstracts in Latin (cf. Nussbaum 1999, 2003). The derived adjective *raucus* [Plt.+] 'hoarse' (< **rau̯iko-,* Leumann 1977: 340f.) would then be based on **rau̯i-*.

4.4.4. A similar pattern may appear in *saucius* (**1.2.**). As I have argued elsewhere (2004: 624), the most reasonable morphological basis involves an original **ksou̯o-* 'scraping', substantivized (→ 'a scrape, wound') with a velar formant **-Vk-* (as in other such terms: *rāmex* 'blood vessel, hernia', *uarix* 'varicose vein', *famex* 'bruise, contusion', etc.); the resulting **(k)sau̯-Vk-* or (with syncope) **(k)sau̯-k-* would then serve as the basis for a derived possessive adjective **sau̯-k-io-* 'having a wound, wounded'. It can now be suggested more specifically that the original *o*-grade was a τομός form **ksou̯-ó-* (> **ksau̯ó-* regularly); for the semantics, compare τομός itself.[77]

4.4.5. Not every word with *au*-diphthong arises from an application of Thurneysen-Havet's Law; but this kind of source is indeed generally assumed for a series of difficult Latin forms, most of which lack clear etymologies, characterized by *au*-diphthong in the root and dental suffix, e.g. *laud-* 'praise', *fraud-* (cf. U. *fros-*) 'deception' (see Schrijver 1991: 444 on these two). In theory, some such items can involve secondary dental stems based on thematic stems that were originally oxytone,

[77] Even if one chooses to operate with an accented *o*-grade source (such as **ksóu̯-Vk-*), the root vocalism could have been remodeled after the Italic **ksau̯éi̯o/e-* discussed at the outset (**1.2.**).

All use subject to JSTOR Terms and Conditions

and thus susceptible to Thurneysen-Havet's Law. Thus for *dautia* 'hospitality gifts', an attractive etymological analysis via the **deu̯H-* or **deh₃-u-* of Ved. *dúvas-* 'reward' etc., including an appeal to Thurneysen-Havet's Law for the root vocalism, has recently been suggested by Driessen (2003: 354f.). One could, for example, begin with a τομός form **dou̯H-ó-* 'bestowing' > **dau̯o-,* which could then have served as the basis for a *t*-stem noun **dau̯-et-* 'bestowal', concretized as **dau̯-et-i̯o-* (whence pl. *dautia*).[78]

Another approach might operate directly with original athematic paradigms that included suffix-accented forms, such as proterokinetic or hysterokinetic *t*-stems or *d*-stems – cf. Rieken's analysis of forms like Lat. *teges* 'covering' in terms of a proterokinetic **tég-ōt-/*tg-ét-* (1999: 92), or the isolated hysterokinetic[79] *d*-stem of IIr. **śarád-* 'cold season'. In such cases, however, *o*-vocalism in the root is difficult to account for.

For some forms, as for a number of others above, analogical remodeling may be a reasonable option. Thus, given an old alternation involving a noun **lóu̯-ed-* 'praise' (cf. OHG *liod* 'song' < **leu̯-t-*) beside its Thurneysen-Havet denominative **lau̯edā̯i̯ó/é-,* the noun could perhaps have been remodeled to **lau̯-ed-* after the denominative.[80] Still, the most natural basis for an *ed*-stem **lou̯-ed-* (or rather **lau̯-ed-*) is a thematic **lou̯-o-,* which could easily have been an oxytone **lou̯-ó-* (> Ital. **lau̯o-* [→ **lau̯-ed-*] regularly).

While such forms certainly pose difficulties, in part because of their uncertain etymological and morphological backgrounds, none constitutes a direct counterexample. Note, finally, that if *fraud-* is already attested with *a*-vocalism in line A3 (]OS : FRA[) of the "Corcolle Altar Fragments" (CIL I^2 2833a, ca. 500 BC), and if the *a*-vocalism results from Thurneysen-Havet's Law (cf. Vine 1993: 81n23), this would constitute proof positive of the archaic nature of the phenomenon and its independence from the Classical Latin accent.

4.4.6. Another apparent counterexample of the *cauus* type (**4.4.2.**) is the verb *lauere* (*lāuī, lautus*) 'bathe, wash (trans.)', where the *a*-vocalism in an initial syllable again appears problematic, at first glance,

---

[78] Somewhat differently Driessen, for the *t*-stem, although he allows for the possibility of a source form like **dou̯H-ó-*. For the morphological pattern *-o-* → *-et-,* cf. the type ἀργός 'shining' → ἀργητ-/ἀργετ- 'id.', etc. (Schindler 1976: 351); with *o*-grade root, e.g. κοῦρος 'youth' → κουρῆτες 'young warriors'.

[79] Or "anakinetic", in Tremblay's analysis (1996: 98f.).

[80] For the antiquity of such denominative formations in **-ā̯i̯ó/é-,* cf. Ven. *donasto* 'gave'.

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

no matter what kind of *o*-grade present (**lóu̯h₃-o/e-*, etc.) one wishes to reconstruct.[81] Beside thematic *lauere,* however, is the *ā*-verb *lauāre* (*lāuī, lautus*), at first with the same meaning, but eventually specialized with intransitive sense. This is also normally taken to derive from an *o*-grade formation, e.g. as denominative to an abstract noun **lou̯h₃-éh₂* (thus LIV), or via an original iterative **lou̯h₃-éi̯o/e-* (thus Rix 1999: 519).[82] Those who prefer to take thematic *lauere* from an old *e*-grade (thus both LIV and Rix) make the relatively straightforward claim that the vocalism of *lauere* is simply reshaped after that of *lauāre*; and the same approach is available if *lauere* continues an old *o*-grade.

This gambit may be at least somewhat problematic, in view of the fact that *lauere* itself has impeccably archaic credentials [Plt., Cato, Enn., Naev.+]. Another explanation could begin with the striking profusion (and persistence) of *x-luere* compounds with preverb, which are far more common than *lauere* itself: thus e.g. *abluere* [Pacuv.+], *alluere* [Lucr.+], *dīluere* [Plt., Cato+], *ēluere* [Plt., Cato+], *prōluere* [Plt.+]; attested later, also *colluere* [Ovid+], *subluere* [Caes.+], cf. *illuere* Prisc. *Gramm.* I.130.13 as the source of *illuuiēs* [Ter.+]. At the same time, with one trivial exception,[83] *lauāre* makes no compounds. Thus an alternative to interpreting the vocalism of *lauere* as remodeled after *lauāre* would be to consider it the regular Thurneysen-Havet's Law result of original *o*-grade forms with preverb, i.e. *lauere* ← **x́-lau̯e-,* with *a*-vocalism regularly from **x́-lou̯e-* (< **x́-lou̯h₃-o/e-*). Note that in this case, the initial accent would reflect not the pre-Latin period of initial stress, but rather a survival in Proto-Italic of the usual pattern seen in Vedic Sanskrit (and normally reconstructed at least for a late stage of Proto-Indo-European) in which verbs in main clauses show unaccented root but accented preverb. An additional source of *a*-vocalism might also have been the verbal adjective, if this was originally proper to the iterative that may underlie *lauāre* – i.e. *lautus* < **lau̯eto-* < (Transponat) **lou̯h₃-etó-*(with **-eto-* restored for **-oto-*), cf. *cautus* (**3.2.**).

4.4.7. A final example of "unshifted *ou̯*" (cf. **2.2.**, **2.3.**) has already been mentioned (**1.3.**), namely the modal forms of the shape /dou̯ī-/ meaning 'give' (and, vis-à-vis PIE **deh₃-* 'id.', with unexpected root-final glide) seen in Fal. *douiad,* U. **-tuvitu**/*-douitu,* **-tuvies**, and (per-

[81] See the detailed discussions by Schrijver (1991: 396f.) and Meiser (1998: 85).

[82] Differently Schrijver (1991: 397), via stative **lau̯a-ē-,* based on **lau̯a-* in *lauere.*

[83] Leumann (1977: 135), who otherwise takes *lauere* from an *o*-grade **louere,* considers *ēluō* to derive from **ēlauō* (to *lauāre*), given *ēlāuī*/*ēlāuisse* (intrans.) in Plautus (4x); but this is essentially a kind of nonce-formation, see Sommer 1914: 562.

haps) OLat. *duim, duat.* The source of these forms constitutes a long-standing problem,[84] the details of which are not essential here. Indeed, the problem of whether these forms belong with a root **deu̯H-* 'bestow' (cf. IEW 218, 2. *deu-* '(religiös) verehren etc.') or (as in LIV) with a *u*-extended version of **deh₃-* 'give' (cf. on *dautia,* **4.4.5.**) can also be left aside; the latter assumption is adopted at the outset for expository convenience (though cf. n. 85 below).

Lat. *duim,* if taken at face value, can reflect a zero-grade root aorist optative stem **duh₃-ih₁-* (thus LIV), and in that case would pose no problem for Thurneysen-Havet's Law. It could well, however, recover an Italic *o*-grade stem **dou̯ī-* (e.g. via a **-duu̯ī-* generalized from prefixed forms; see Leumann for details), and would thus, together with the Faliscan and Umbrian forms, need to be accounted for. According to LIV, these reflect a full-grade *i̯o/e*-present "Neubildung" based on the root aorist stem **dou̯-* < **déh₃u-*. If so, the pre-Italic **dóu̯-i̯o/e-* in question (with /ou̯/-diphthong followed by consonant) would not have met the structural description of Thurneysen-Havet's Law; and later forms with /ou̯V/ (**dóu̯-ii̯o/e-, *dóu̯-ii̯ā-,* etc.) would no doubt have retained the root accent into the Italic period, hence remaining unsusceptible to Thurneysen-Havet's Law.[85] According to a different account (Jasanoff 1991: 108n15),[86] the Italic modal forms pointing to **dou̯ī-* continue the inherited root aorist optative of unenlarged **deh₃-,* which in Jasanoff's reconstruction showed full grade of the root in 1 pl. and 2 pl. (thus **déh₃-ih₁-me, *déh₃-ih₁-te*). For the resulting **dó-ī-mos, *dó-ī-te* (at first with hiatus between root and suffix), Jasanoff suggests that contraction would have been inhibited by the morpheme boundary, and that a hiatus-breaking *u̯*-glide would have been inserted between the root and the mood sign (**dó(u̯)ī-* > **dóu̯ī-*). In this event, the attested forms, without application of Thurneysen-Havet's Law, could again point to a retention in Italic of root-accented **dóu̯ī-,* rendering such material just as unproblematic for the present theory as in the LIV or Driessen versions of its morphological background.[87]

---

[84] See Leumann 1977: 528, Meiser 1986: 186ff., LIV s.v. **deh₃u̯-,* Driessen 2003: 355n12. Here also Sicel *dohit* (Prosdocimi 1998: 344)?

[85] Equally unproblematic is an analysis via *e*-grade **déu̯H-i̯o/e-* to a root **deu̯H-* (as favored by Driessen, loc. cit.), since Thurneysen-Havet's Law predates **eu̯* > Ital. **ou̯.*

[86] In effect an elegant version of a solution proposed by Szemerényi; see Leumann's discussion (n. 84), with references.

[87] Yet another recent account that operates with plain **deh₃-* is that of Rasmussen (1999), who proposes a series of analogies (partly based on *fu-*) that would again pose no problem for Thurneysen-Havet's Law.

5. Lat. *fauīlla*: a new Thurneysen-Havet's Law etymology

5.1. One index of the value of a new theory is its ability to generate solutions to hitherto recalcitrant problems. Lat. *fauīlla* 'ashes, embers' [Ter.+] is an extreme case, posing severe etymological difficulties. As shown by Schrijver (1991: 442f.), the traditional comparison with *foueō* 'warm' cannot be accepted, whether the *a*-vocalism of *fauīlla* is interpreted via Thurneysen-Havet's Law (which should not operate on the result of **-og$^{\mu h}$V-* > **-ou̯V-*) or in terms of a zero grade with "reduced vowel" (i.e. a **d^{h}$_{e}$g$^{\mu h}$-*, impossible to defend). As for the suffix formation: the length of the *-ī-* is guaranteed both by inscriptional spelling with "I longa" (CIL V 3143) and by Romance forms (see Meyer-Lübke 1935: 280). Schrijver suggests that this points to a source like **-i-Hn-leh$_2$* (perhaps based on an *i*-stem), noting futher that "[i]t is in fact very difficult to reconstruct an acceptable conglomerate of PIE. suffixes that would have yielded Lat. *-īlla*". He concludes that the origin of the form is unclear, and that the word may be an "unknown borrowing".

5.2. There is, however, an attractive root etymology that seems never to have been considered, namely comparison with the root **d^{h}eu̯h$_2$-* (LIV[1]) or **d^{h}u̯eh$_2$-* (LIV[2]) 'Rauch machen'[88] of Lat. *suffīre* 'fumigate', *fūmus* 'smoke', *fūlīgō* 'soot', to cite only Latin material. According to this suggestion, *fauīlla* would constitute an isolated Thurneysen-Havet's Law form, with Lat. prevocalic *fau̯V-* deriving from **d^{h}ou̯h$_2$-V-*.

5.3. Note further that an original root shape **d^{h}eu̯h$_2$-* for the verbal root (as in LIV[1]) is not required. Like the primary verb formations,[89] most of the old-looking nominal derivatives are zero grades, e.g. **d^{h}uh$_2$-mó-* (Lat. *fūmus,* Ved. *dhūmá-,* θυμός, OCS *dymŭ,* etc.), **d^{h}uh$_2$-li-* (Lat. *fūlīgō,* Skt. *dhūli-/dhūlī-* 'dust, soil, powder', Li. *dū́lis* 'smokescreen' [used in bee-keeping]), and other isolated and possibly archaic items (e.g. OIr. *dé* 'smoke',[90] Hitt. *tuḫḫuwāi-/tuḫḫuwī-*[91] 'smoke, vapor', Toch. A *twe*/B *tweye* 'dust'[92]). Thus, even for an original root **d^{h}u̯eh$_2$-* (as in LIV[2]), one might well expect to find "wrong" full grades – which in fact are attested, as in CS **dujǫ/duti* 'blow', Go. *dauns* 'sense of smell; fragrance'. Thus a basis **d^{h}ou̯h$_2$-* for Lat. *fauīlla* raises no serious difficulties in terms of root structure.

---

[88] Or (Watkins 2000: 19) "'to rise in a cloud', as dust, vapor, or smoke".

[89] Gk. θύω 'sacrifice', Lat. *suffīre,* etc. (see LIV).

[90] Watkins 1966: 118n9, cf. more recently Schrijver 1995: 337 and (with other references, as well as alternative conceptions of the root shape) Vijūnas 2006: 132.

[91] For the etymology from **d^{h}eu̯h$_2$-,* see recently Zeilfelder 2000: 503f., 2001: 254.

[92] Ringe 1996: 52.

All use subject to JSTOR Terms and Conditions

5.4. Given the profile of the above material, involving a root etymology for an isolated form, one can do little more than speculate about the morphological and semantic details of the formation. It is possible, nevertheless, to provide plausible derivational scenarios, based on the assumption that an early Italic **þou̯-V-* (< PIE **dʰou̯h₂-V-*) has led to Lat. **fau̯V-* by an application of Thurneysen-Havet's Law. One possible starting point (cf. Schrijver's remarks on the suffix formation, **5.1.**) would be a primary acrostatic *i*-stem **dʰóu̯h₂-i-*, with a meaning like 'smoke' or 'soot' (for example, substantivized from an *i*-abstract 'smokiness').[93] But the remainder of the suffix formation need not involve a segmentation **-i-Hn-* (Schrijver, **5.1.**), with a formant like the Hoffmann-suffix. The paradigm of such an *i*-stem would include instr. sg. **dʰóu̯h₂-ih₁* 'with smoke/soot', which would yield an early Italic **þóu̯ī*. As Nussbaum has shown (1996, 1998), instrumental singular forms of this sort are apt to serve as the basis for derived "de-instrumental" adjectives, fitted out with one or another of the productive adjective formants, especially **-no-* and **-to-*.[94] The former, in PIE terms, is typically oxytone in adjectival function, in both primary and secondary formations. If this accentual feature was retained into Proto-Italic, the derivational sequence would be **þóu̯ī* 'with smoke/soot' → **þou̯ī-nó-* (adj.) 'smoky, sooty' > **þau̯īnó-* (by Thurneysen-Havet's Law).[95] The age of the subsequent *l*-formation is impossible to determine, so that the notation with Italic **þ-*, as opposed to "pre-Latin" **f-*, becomes arbitrary at this point. All that remains, in any case, is the further derivation via nominalizing **-lo-* (or diminutive **-elo-*), ap-

---

[93] If, as is now generally assumed, Hitt. *tuḫḫima-* means 'panting, gasping' or the like (and not, as previously, 'cry of pain [esp. during birth]') and belongs with this root (thus e.g. Schrijver 1991: 233), it may preserve an indirect trace of just such an *i*-stem **dʰóu̯h₂-i-*, if the *-ima-* formation involves a remodeling of an original **tuḫḫi-*, and if the unlenited *-ḫḫ-* (for expected **tūḫi-*) could be accounted for. As Craig Melchert points out to me, the *-ḫḫ-* could be ascribed to the influence of the verb *tuḫḫāi-* 'pant', and a parallel for the derivation **tuḫḫi-* → *tuḫḫima-* might be available in Hitt. *ekunima-* 'cold', which could involve a secondary *i*-stem **ekuni-* (for the type, see Melchert 1999) beside the adjective *ekuna-*, with **ekuni-* remodeled to *ekunima-* so as to fit the expanding class of *-ima-* nouns. According to Oettinger (2001: 463), *tuḫḫima-* is simply derived from the verb *tuḫḫāi-*, but this is not likely to be correct: *tuḫḫāi-* inflects as an *-āizzi-*verb, not a *ḫi-*verb, and thus has no allomorphs †*tuḫḫi(-)*/†*tuḫḫiya-*. (I am extremely grateful to Craig Melchert for generous help with the Hittite material in this note, as well as on Hitt. *tuḫḫuwāi-*/*tuḫḫuwī-* (**5.3.**).)

[94] Applications of this theory appear in Vine 1999, Peters 1999.

[95] A concomitant necessary assumption (not particularly difficult) is that the original *i*-stem **þóu̯-i-* itself (possibly in competition with **þūmó-* from the beginning, and now divorced, by virtue of its aberrant vocalism, from its derivative **þau̯īnó-*) would have been lost.

This content downloaded from 185.44.78.129 on Tue, 17 Jun 2014 14:46:09 PM
All use subject to JSTOR Terms and Conditions

parently specialized as a feminine (and thus possibly with collective function); hence **þau̯īnó-* → pre-Lat. **fau̯īn-(e)lā* '(small?) smoky/ sooty stuff' = 'ashes, embers' > *fauīlla.* Note also that the complexity of the suffixal formation itself calls for a relatively involved derivational history – a requirement certainly fulfilled by an analysis like that just offered.

The same result could be achieved using other derivational sources. Thus, if one begins with an *o*-grade thematic * $d^{h}o\underset{\frown}{u}h_2$-*o*- 'smoking' (whether conceived as a τόμος or τομός form), a "de-genitival" adjective * $d^{h}o\underset{\frown}{u}h_2$-*iH-nó*- 'smoking (adj.)' (of the type *equo*- 'horse' → *equīnus* 'of a horse', etc.; Nussbaum, opp. citt.) will again regularly yield Italic **þau̯īnó-*. If, moreover, the starting point was a τομός form *$d^{h}o\underset{\frown}{u}h_2$-*ó-,* this would have produced a **þau̯o-* (with *a*-vocalism) from the very start of the derivational chain, comparable to the other τομός forms suggested above (as in *cauus, rauus,* and the derivational backgrounds of *saucius* and *dautia*).

6. Conclusions

The results of this study – some of them necessarily tentative – can be summarized as follows:

(i) By virtue of its relative chronology (as analyzed by Schrijver) and the fact that it may have operated in U. *sauitu* (**1.2.**, Vine 2004: 622ff.) and perhaps Ven. *ho.s.tihauo.s.* (**4.4.1.**), Thurneysen-Havet's Law is among the earliest innovations of Proto-Italic (and perhaps the earliest). The traditional account in terms of the Classical Latin accent is therefore untenable.

(ii) The law was conditioned by the remnants of the PIE mobile accent system in Proto-Italic (**3.1.**, **4.2.**, **4.2.1.**); its Latin traces are thus comparable to other Latin phenomena suspected of being conditioned by a mobile accent that predated the Common Italic period of initial stress (**4.2.2.**).

(iii) Thurneysen-Havet's Law converted unaccented /o/ (in terms of the presumed Proto-Italic mobile accent system) to /a/, in the position before a heterosyllabic /u̯/ (**4.1.**). The restriction of the process to heterosyllabic position can be correlated with general facts about the phonetics of lip rounding (Kaun 2004) and about feature-spreading within and across syllable boundary. (See further (v) and (viii).)

(iv) The rule operated on two major categories of forms in which a pretonic Proto-Italic **o* preceded a heterosyllabic labial glide:

(a) Italic descendants of PIE iterative-causatives: U. *sauitu* (1.2.), Lat. *cauēre* (**1.1.**, **3.2.**), *fauēre* (**3.3.**), *auēre* (**3.4.**), (?) *lauāre* (**4.4.6.**, Rix 1999: 519) (< **kou̯-éi̯o/e-* etc.);[96]

(b) Italic descendants of PIE τομός forms: *cauus* (**4.4.2.**), *rauus* (**4.4.3.**), *saucius* (**4.4.4.**) (?) *dautia* (**4.4.5.**, Driessen 2003: 354f.), (?) *laus* (**4.4.5.**), (?) *fauīlla* (**5.4.**) (< **kou̯-ó-* etc.).

Other possible pretonic cases include **lou̯-á́* → *lauāre* (**4.4.6.**, LIV; but cf. (a) above) and Ven. *ho.s.tihauo.s.* (**4.4.1.**).

(v) The unaccented /o/ was not restricted to (first) pretonic position (**4.2.**). Possible examples of Thurneysen-Havet's Law operating in other unaccented positions include the following:

(a) *second pretonic*

• verbal adjectives in **-etó-*, e.g. **kou̯-etó-* > *cautus* (**3.2.**), **lou̯-etó-* > *lautus* (**4.4.6.**);

• (factitive) **kou̯-āi̯ó/é-* > *cauāre* (**4.4.2.**);

• (de-instrumental or de-genitival adjective) **þou̯-ī-nó-* → *fauīlla* (**5.4.**) (or as in (iv.b) above);

• (diminutive) **ou̯i-ló-* → *auilla* (**4.4.1.**).

(b) *third pretonic*

• (compound) **ou̯i-φolkó-* > *aubulcus* (**4.4.1.**)

• (compound) **ou̯i-pol-ó-* or **ou̯i-pa-ló-* → *ōpiliō* (**4.4.1.**);

• (denominative) **lou̯-ed-ā-i̯ó/é-* > *laudāre* (**4.4.5.**).

(c) *first posttonic*

• (preverb + verb) **ǵ-lou̯-o/e-* → *lauere* (**4.4.6.**).

(vi) Non-application of Thurneysen-Havet's Law is regular for Proto-Italic accented **ó* (cf. (ii), (iii) above), as in **óu̯i-* 'sheep' (**2.3.2.**, **3.6.**; PIE acrostatic noun), forms of (non-Lat.) **bóu̯-* 'cow' (**2.3.1.**, **3.7.**; PIE acrostatic root noun), τόμος forms or substantives derived by accent-retraction (**kóu̯-ā* in Port. *cova,* Span. *cueva* etc., **4.4.2.**), modal **dóu̯-ī-*, **dóu̯-i̯i̯ā-* (**4.4.7.**, if ultimately built on the full-grade active root aorist to **deh₃-* 'give').

(vii) The potentially serious Latin exceptions to Thurneysen-Havet's Law (as formulated here) can involve earlier *e*-grades, directly or indirectly (*nouācula,* **2.2.1.**; *cloāca/cloāre,* **2.2.2.**; *mouēre,* **2.2.3.**), or are otherwise not probative (†*touēre,* **2.2.4.**).

(viii) The restriction of the rule to sequences /o$u̯V/, with heterosyllabic /o/ and /u̯/, contrasts with the PIE source forms of many Thurneysen-Havet cases, in which /o/ and /u̯/ were tautosyllabic by virtue of a root-final laryngeal – thus PIE */kou̯$h₁éi̯e-/ vs. Pr.-It.

[96] Reconstructions here and below provide Proto-Italic input forms.

*/ko$u̯éi̯e-/, etc.; the phonologization of Thurneysen-Havet's Law may be related to this systematic change in syllable structure (**4.1.**).[97]

(ix) The traditional etymology of Lat. *fauīlla* 'ashes, embers' (: *foueō* 'warm') cannot be correct; the word may instead be a Thurneysen-Havet form based on PIE *$d^heu̯h_2$- or *$d^hu̯eh_2$- 'Rauch machen' (: *fūmus* 'smoke' etc.) (**5.**).[98]

[97] Compare Brugmann's Law, where the lengthening of PIE *o in open syllables is blocked in laryngeal-final roots: the laryngeal serves to close the syllables in question, and these effects surface prominently in the same two categories as with Thurneysen-Havet's Law, i.e. iterative-causatives and τόμος/τομός forms (see in these terms Mayrhofer 1986: 148; for the nominal forms, Hajnal 1994).

[98] Earlier versions of this paper were presented at a UCLA Program in Indo-European Studies "Round Table" meeting (Los Angeles; February 2004), at the workshop "Language and Dialect in Archaic Italy" (University of California, Berkeley; March 2004), and before the Department of Linguistics at Tokyo University (October 2004). I extend my gratitude to the audience members at those occasions for their helpful comments and discussion. Warm thanks, especially, are owed to Kazuhiko Yoshida (Kyoto University), whose generous hospitality and support enabled me to write the bulk of this paper under ideal conditions during my sabbatical time in Kyoto, and to Moss Pike (Program in Indo-European Studies, UCLA), for his indispensable research assistance.
